**THOMASIUS**. I. Christian, a German philosopher, born in Leipsic in January, 1655, died in Halle, Sept. 23, 1728. He was educated by his father, the rector of the celebrated *Thomas-schule*, and from 1675 to 1679 studied at Frankfurt-on-the-Oder. Returning to Leipsic in 1679, he undertook a course of lectures at the university, and in 1687 he began to lecture in the German instead of the Latin language. From 1688 to 1690 he issued a monthly series of papers devoted chiefly to current literature. Persecution finally forced him to flee from Leipsic, and he went to Berlin, where he was kindly received by the elector Frederick III., afterward King Frederick I. of Prussia. He subsequently delivered lectures at Halle, and his success induced the elector in 1694 to found the university of Halle, of which in 1710 Thomasius became rector and dean of the faculty of jurisprudence. It was principally by his exertions that trials for witchcraft and torture were abolished in Germany. His most important works are: *Historie der Weisheit und Thorheit* (Halle, 1698), and *Vernünftige und christliche, aber nicht scheinheilige Gedanken und Erinnerungen über allerhand auserlesene, gemischte philosophische und juristische Händel* (3 vols., 1723-'6). His life

has been written by Luden (*Christian Thomasius nach seinen Schicksalen und Schriften*, Berlin, 1805), and by Wagner (1872). **II. Gottfried**, a German theologian, a descendant of the preceding, born in 1802, died in 1875. He was a Lutheran pastor and teacher in Nuremberg from 1829 to 1842, and for the rest of his life professor of dogmatics at Erlangen. He was one of the founders of the *Zeitschrift für Protestantismus und Kirche*. His works include, besides treatises on the Lutheran church, *Origines: ein Beitrag zur Dogmengeschichte des 8. Jahrhunderts* (1837); *Beiträge zur kirchlichen Christologie* (1845); and *Christi Person und Werk* (3 vols., 1856-'64).

**THOMASSIN, Louis de**, a French theologian, born in Aix, Provence, Aug. 28, 1619, died in Paris, Dec. 24, 1695. He studied in the college of Marseilles, became a member of the French Oratory, was appointed to the chair of philosophy in the college of Pézenas, where he adopted Platonic principles, and taught dogmatic theology for six years at Saumur. From 1654 to 1667 he was professor of dogma in the seminary of St. Magloire, Paris, also delivering lectures on church history and discipline. He seemed at first to favor the opinions of the Jansenists, but soon declared against them. In 1667 he published *Dissertationes in Concilia Generalia et Particularia*, in which he taught that to the pope alone belongs the right of assembling general councils; that these councils are not in themselves necessary; that in all matters of discipline and government the authority of the pope is superior to that of a general council; that the question of papal infallibility should never be discussed, but that it was "sufficient to hold that the pope is greater than himself when at the head of a council, and a council inferior to itself when separated from the pope." These opinions aroused the hostility of the parliament and of the Gallican portion of the clergy, and the regent suppressed the work. His most important works are: *Mémoires sur la grâce* (3 vols. 8vo, 1668; 2 vols. 4to, 1682); *Ancienne et nouvelle discipline de l'Eglise touchant les bénéfices et les bénéficiers* (3 vols. fol., 1678-'9; translated into Latin by the author, 1688, 1728); *Dogmata Theologica* (3 vols. fol., 1680-'89; 6 vols., 1864-'9); *Traité de l'unité de l'Eglise et des moyens que les princes chrétiens ont employés pour y faire rentrer ceux qui en étaient séparés* (1686-'8); and *Traité des édits et autres moyens spirituels et temporels dont on s'est servi dans tous les temps pour établir et pour maintenir l'unité de l'Eglise catholique* (3 vols. 4to, 1708).

**THOMASTON**, a town of Knox co., Maine, adjoining Rockland, on the Knox and Lincoln railroad, 60 m. E. N. E. of Portland; pop. in 1870, 3,092. The state prison is situated here, and extensive granite quarries in the neighborhood are worked by convict labor, which is also employed in the manufacture of boots, shoes, and carriages. The inhabitants are chiefly engaged in manufacturing and export-

ing lime and in ship building. About 140,000 casks of lime are produced annually. There are a few other manufactories, two national banks, a savings bank, a fire insurance company, and six churches. Thomaston was incorporated in 1777, and included until 1848 Rockland and South Thomaston.

**THOMPSON**, a S. E. central county of Dakota, recently formed and not included in the census of 1870; area, about 925 sq. m. It is intersected by the Dakota or James river and its N. fork. The surface is rolling prairie.

**THOMPSON, Augustus Charles**, an American clergyman, born in Goshen, Conn., April 30, 1812. He was educated at Yale college, at the theological seminary at East Windsor Hill, Conn., and at the university of Berlin. Since 1842 he has been pastor of the Eliot Congregational church, Roxbury, Mass. In 1854-'5 he accompanied the Rev. Dr. Anderson as a deputation to the missions of the American board in India. He has published "Songs in the Night" (Boston, 1845); "The Lamb Fed," which has been translated into the Marhatta language; "The Young Martyrs;" "Last Hours, or Words and Acts of the Dying" (1851); "The Poor Widow, a Memorial of Mrs. Anna F. Waters" (1854; translated into Tamil); "The Better Land, or Believer's Journey and Future Home" (1855); "The Yoke in Youth, a Memorial of H. M. Hill" (1856); "Gathered Lilies, or Little Children in Heaven" (1858); "Feeding the Lambs" (1859); "Morning Hours in Patmos" (1860); "Lyra Cœlestis" (1863); "The Mercy Seat" (1863); "Seeds and Sheaves" (1868); and "Christus Consolator" (1869).

**THOMPSON, Benjamin**. See RUMFORD.

**THOMPSON, Daniel Pierce**, an American novelist, born in Charlestown, Mass., Oct. 1, 1795, died in Montpelier, Vt., June 6, 1868. He graduated at Middlebury college in 1820, was private tutor for several years, and was admitted to the bar in Virginia. He practised law in Montpelier, Vt., and held the offices of register of probate, clerk of the legislature, compiler of the statutes, judge of probate, clerk of the county and of the supreme court, and secretary of state. He published "May Martin, or the Money Diggers" (1835, many times reprinted); "Adventures of Timothy Peacock" (1835); "The Green Mountain Boys" (Montpelier, 1840); "Locke Amsden," a graphic picture of the New England district school as it was (Boston, 1847); "Lucy Hosmer" (1848); "The Rangers, or the Tory's Daughter" (1850); "Gant Gurley, or the Trappers of Lake Umbagog" (1857); "The Doomed Chief" (1860); and "History of the Town of Montpelier, Vermont" (1860). From 1849 to 1856 he edited the "Green Mountain Freeman" newspaper.

**THOMPSON, Elizabeth**, an English painter, born in London about 1850. In 1874 she acquired great fame by her "Roll Call," relating to the Crimean war, which was purchased by the

queen. In the summer of 1875 she exhibited another military picture, and at the close of the same year, on her return from Italy, a "Vintage Sketch in Tuscany."

**THOMPSON, Sir Henry**, an English surgeon, born at Framlingham, Suffolk, Aug. 6, 1820. He was educated at University college, London, became assistant surgeon of the college hospital in 1853, surgeon in 1863, and professor of clinical surgery in 1866, and was knighted in 1867. He has published "The Pathology and Treatment of Stricture of the Urethra" (London, 1853; 3d ed., 1869); "The Enlarged Prostate, its Pathology and Treatment" (1857; 2d ed., including the Jacksonian prize essay of the royal college of surgeons for 1860, 1861; 3d ed., 1868); "Practical Lithotomy and Lithotripsy" (1863; 2d ed., 1871); and "Clinical Lectures on Diseases of the Urinary Organs" (1868; 2d ed., 1870).

**THOMPSON, Joseph Parrish**, an American clergyman, born in Philadelphia, Aug. 7, 1819. He graduated at Yale college in 1838, studied theology at Andover and New Haven, and was ordained pastor of the Chapel street Congregational church, New Haven, in November, 1840. From 1845 to 1872 he was minister of the Broadway Tabernacle church in New York. While at New Haven he was one of the originators of the "New Englander," a Congregational quarterly review, and he was also one of the founders of the "Independent" newspaper. In 1852 he originated the plan of the Albany Congregationalist convention. He was also a manager of the American Congregational union, and of the American home missionary society. In 1852 he visited Palestine, Mt. Sinai, Egypt, and other oriental countries; and he has since devoted much time to oriental studies, especially Egyptology, the results of which have appeared in his contributions to the "North American Review," the "Bibliotheca Sacra," the "Journal of the American Geographical and Statistical Society," Smith's "Dictionary of Biblical Geography and Antiquities," and the revised edition of Kitto's "Cyclopædia of Biblical Literature." Harvard university conferred upon him the degree of D. D. in 1856. He now (1876) resides in Berlin. Dr. Thompson has published "Mémorial of Timothy Dwight" (New Haven, 1844); "Lectures to Young Men" (New York, 1846); "Hints to Employers" (1847); "Mémorial of David Hale" (1850); "Foster on Missions, with a Preliminary Essay" (1850); "Stray Meditations" (1852; revised ed. entitled "The Believer's Refuge," 1857); "The Invaluable Possession" (1856); "Egypt, Past and Present" (Boston, 1856); "The Early Witnesses" (1857); "Mémorial of Rev. David T. Stoddard" (New York, 1858); "The Christian Graces" (1859); "The College as a Religious Institution" (1859); "Love and Penalty" (1860); "Bryant Gray" (1863); "Christianity and Emancipation" (1863); "The Holy Comforter" (1866); "Man in Genesis and

Geology" (1869); "Theology of Christ, from His Own Words" (1870); "Home Worship" (1871); "Church and State in the United States" (1874); and "Life of Christ" (1875).

**THOMPSON, Launt**, an American sculptor, born in Queen's county, Ireland, in 1838. He came to the United States at an early age with his mother, a widow, who settled in Albany, N. Y. While studying in the medical college he also attended a drawing school, and was encouraged in his taste for art by William Hart and E. D. Palmer. When the latter opened a studio for sculpture in Albany, Thompson became his pupil, and remained with him nine years, making himself known by his ideal head of "Little Nell" which he twice copied to fill orders, and by his busts and medallion portraits. In 1858 he settled in New York, and was elected an associate of the national academy of design. In 1859 his bust of the "Trapper" secured his election as an academician, and he soon after became a member of the council; and he also served on the committee for the erection of the new building of the academy. He now (1876) resides in Florence, Italy. Among Mr. Thompson's principal works are a statue of Gen. John Sedgwick, erected at West Point; a colossal statue of Napoleon, now owned by Mr. Pinchot of Milford, Pa.; a statue of Gen. Winfield Scott, erected at the soldiers' home near Washington; a soldiers' monument at Pittsfield, Mass.; a statue of the Rev. Abraham Pierson, first president of Yale college, erected in the college grounds; and many busts and bass-reliefs.

**THOMPSON, Thomas Perreux**, an English political reformer, born in Hull, March 15, 1783, died Sept. 6, 1869. In 1803 he entered the navy as midshipman, and in 1806 went into the army as second lieutenant. In 1808 he was made governor of Sierra Leone. One of his first acts was to issue a proclamation for the suppression of the slave trade in the colony; and the opposition raised against him by the slave traders caused his recall. He arrived in England in 1810, returned to the army, and served in the peninsular campaign of 1813, in France in 1814, and afterward in the Pindaree campaign in India. In 1819, having learned Arabic, he accompanied Sir William Keir Grant in the expedition up the Persian gulf, and assisted in the negotiation of the treaty with the Arab tribes, by which the slave trade was declared piracy. In 1854 he was made major general. In 1814 he published a work entitled "On a Constitution." He was one of the contributors to the "Westminster Review" on its establishment in 1824, and five years afterward became joint proprietor, writing for it constantly till 1836. His "Corn Law Catechism" (1827) was the most effective attack upon the protectionist system. He was several times elected to parliament. A selection from his miscellaneous writings was published (6 vols., 1842).

**THOMPSON, Waddy**, an American lawyer, born at Pickensville, S. C., Sept. 8, 1798, died in

Tallahassee, Fla., Nov. 23, 1868. He graduated at the South Carolina college in 1814, and was admitted to the bar in 1819. He was a member of the legislature from 1826 to 1830, when he became solicitor of the western circuit. During the nullification excitement he was elected by the legislature brigadier general of militia (1835). From 1835 to 1841 he was a member of congress, and was prominent in debate as a leader of the whig party. In 1842 he was appointed minister to Mexico. During his mission, he made two important treaties, and procured the liberation of more than 200 Texan prisoners, many of whom were sent home at his own charge. On his return he published "Recollections of Mexico" (8vo, New York, 1846).

**THOMPSONVILLE**, a village in the town of Enfield, Hartford co., Connecticut, 17 m. N. of Hartford; pop. about 3,500. It is on the E. bank of the Connecticut river, and on the New Haven, Hartford, and Springfield railroad. It is chiefly noted for its manufacture of carpets, being the seat of the Hartford carpet company's works, which, according to the latest returns, contain 297 looms and produce 2,600,000 yards annually.

**THOMS, William John**, an English antiquary, born in Westminster, Nov. 16, 1808. He was for some years clerk of printed papers in the house of lords, and in 1862 was appointed sub-librarian of that house. His first separate publication was "A Collection of early Prose Romances" (3 vols., 1828). This was followed by "Lays and Legends of Various Nations" (1834); "Book of the Court" (1838); "Three Notelets on Shakespeare" (1865); and "Hannah Lightfoot, Queen Charlotte, and the Chevalier d'Eon" (1867). He has also edited "Anecdotes and Traditions" (1839), "Stow's Survey of London" (1842), and "Caxton's Reynard the Fox" (1844). His reputation rests principally on the establishment of the periodical "Notes and Queries."

**THOMSON. I. Anthony Todd**, a British physician, born in Edinburgh, Jan. 7, 1778, died at Ealing, Middlesex, July 3, 1849. He was educated at the high school of Edinburgh, studied medicine, in 1798 became a member of the speculative society, and in 1799 of the royal medical society, and in 1800 settled in London as a general practitioner. In 1826 he became a member of the royal college of physicians, in 1828 professor of materia medica in London university, now University college, and in 1832 professor of medical jurisprudence. His works include "The London Dispensatory" (8vo, 1811), and "Elements of Materia Medica" (8vo, 1832), both many times reprinted. **II. Katherine Byerly**, an English authoress, wife of the preceding, born in Etruria, Staffordshire, in 1800, died in Dover, Dec. 17, 1862. She published "Memoirs of the Court of Henry VIII." (2 vols. 8vo, London, 1826); "Memoirs of Sarah, Duchess of Marlborough, and of the Court of Queen Anne" (2 vols., 1839); "Me-

moirs of the Jacobites of 1715 and 1745" (3 vols., 1845); "Memoirs of the Viscountess Sundon," &c. (2 vols., 1847); "Recollections of Literary Characters and Celebrated Places" (2 vols., 1853); "Court Secrets" (3 vols., 1857); "Life and Times of George Villiers, Duke of Buckingham" (3 vols., 1860); and several novels. "Queens of Society" and "Wits and Beaux of Society" were written with her son, John Cockburn Thomson, under the pseudonyms of Grace and Philip Wharton.

**THOMSON, Charles**, an American patriot, born at Maghera, county Derry, Ireland, Nov. 29, 1729, died at Lower Merion, near Philadelphia, Aug. 16, 1824. He came to America at the age of 11, was educated in Maryland, taught a Friends' academy in Philadelphia, and afterward went into business in that city, and was an intimate friend of Franklin. He was secretary of the continental congress throughout its existence (1774-'88), and of the first United States house of representatives till his resignation in July, 1789. John Adams called him "the Sam Adams of Philadelphia, the life of the cause of liberty." He was the author of "An Enquiry into the Causes of the Alienation of the Delaware and Shawanese Indians" (8vo, London, 1759); a translation of the Bible, the first English version of the Septuagint (4 vols. 8vo, 1808); and "A Synopsis of the four Evangelists" (1815).

**THOMSON, Edward**, an American clergyman, born in Portsea, England, in October, 1810, died in Wheeling, W. Va., March 22, 1870. In 1819 his parents settled in Wooster, Ohio. He graduated in medicine at the university of Pennsylvania in 1829, and in 1833 joined the Ohio Methodist Conference. In 1838 he became principal of Norwalk seminary, Ohio, and in 1844 was elected by the general conference editor of the "Ladies' Repository." In 1845 he became president of the Ohio Wesleyan university at Delaware, Ohio, and in 1860 was elected editor of the "Christian Advocate and Journal." He was elected bishop in 1864, made an extensive tour of missionary observation in Germany, Scandinavia, Bulgaria, India, and China, and organized the Indian mission into an annual conference. He was a member of every general conference from 1840 to 1864. He published "Educational Essays" (new ed., Cincinnati, 1856); "Moral and Religious Essays" (1856); "Biographical and Incidental Sketches" (1856); "Letters from Europe," notes of a tour through England, France, and Switzerland (1856); "Letters from India, China, and Turkey" (2 vols., 1870).

**THOMSON, James**, a British poet, born at Ednam, Roxburghshire, Scotland, Sept. 11, 1700, died at Kew Lane, near Richmond, Aug. 27, 1748. He was the son of a clergyman, and passed six years at the university of Edinburgh, the last four of which were devoted to theological studies. About 1724 he went to London, and for several months was tutor in the family of Lord Binning. A fragment of

blank verse, written by him at the age of 14, was first published in a life of the poet by Allan Cunningham in 1841. He published in March, 1726, his blank verse poem of "Winter," for the copyright of which he received three guineas, and three editions were called for in a year. In 1727 appeared "Summer," followed by "Britannia" and a "Poem sacred to the Memory of Sir Isaac Newton;" in 1728, "Spring;" and in 1730, "The Seasons," completed by the addition of "Autumn," in a 4to volume, of which 454 copies were subscribed for at a guinea each. In 1729 he produced "Sophonisba," a tragedy, acted with moderate success at Drury Lane. In 1731-'2 he travelled on the continent as tutor of the son of Sir Charles Talbot, afterward lord chancellor, and on his return to England commenced an elaborate poem on "Liberty" (5 parts, 1735-'6). It was abridged by Lord Lyttelton in collecting the author's works for publication, and in that condition it still appears. He had meanwhile been placed in easy circumstances by the appointment of secretary of briefs in the court of chancery, bestowed upon him by Lord Talbot. After the death of the chancellor in 1737 he lost the place, but received from the prince of Wales a pension of £100 a year. He now produced successively his dramas "Agamemnon" (1738), which narrowly escaped being damned on the first night, and "Edward and Eleanor," the representation of which was prohibited under the operation of the act for licensing dramatic performances; the masque of "Alfred," written in conjunction with Mallet, which contains the celebrated song and chorus, "Rule Britannia," set to music by Dr. Arne; and "Tancred and Sigismunda," performed with success at Drury Lane in 1745. About this time he was appointed surveyor general of the Leeward islands, the duties of which were discharged by a deputy, while the clear emoluments amounted to £300 a year; and the latter part of his life was passed in an elegant retreat at Kew Lane. In 1748 appeared "The Castle of Indolence," on which he had labored for many years. His posthumous play of "Coriolanus" was performed at Covent Garden. Thomson was a man of gross appearance and exceedingly indolent disposition. The latest edition of his complete works is in two volumes (London, 1870).

**THOMSON. L. James,** a British civil engineer, born in Belfast about 1816. He was educated in Belfast and Glasgow, where his father was professor of mathematics. He took the master's degree in 1840, studied civil engineering and mechanics, became a pupil in the Horseley iron works, near Tipton, South Staffordshire, entered the service of William Fairbairn, and afterward settled in Belfast as a civil engineer. In 1857 he was appointed professor of civil engineering in Queen's college, Belfast, and in 1872 professor of engineering and mechanics in the university of Glasgow. Prof. Thomson has been prominently employed as a consult-

ing engineer for water supply, irrigation, and other agricultural engineering. He invented the vortex turbine, and the jet pump and intermittent reservoir, for draining swamp lands. His investigations of the lowering by pressure of the freezing temperature of water suggested the perfect solution of the problem of glaciers. About 40 papers by him on physics, mathematics, and mechanics have been published in the "Cambridge and Dublin Mathematical Journal," the "Edinburgh Philosophical Journal," the "Transactions" of the royal societies of London and Edinburgh, the "Proceedings" of the British association, and the "Transactions" of the institution of engineers of Scotland. **II.** Sir **William,** a British mathematician, brother of the preceding, born in Belfast in June, 1824. He studied in Glasgow university, and afterward at Cambridge, where he graduated in 1845, and became a fellow of St. Peter's. In 1846 he was made professor of natural philosophy in Glasgow university, which post he still holds (1876). For seven years he was editor of the "Cambridge and Dublin Mathematical Journal," among his contributions to which was one on "Distribution of Electricity on Spherical Conductors" (1848). In 1855 he delivered the Bakerian lecture on "Electrodynamic Properties of Metals." He has constructed several beautiful instruments for the study of electrical phenomena, and is at present engaged in perfecting a tide-calculating machine. He invented the mirror galvanometer and syphon recorder, for ocean telegraphy, which, owing to their extreme delicacy, can be worked by very low battery power. He has made important contributions to the science of magnetism, and investigated the laws of heat. (See **HEAT**.) He was knighted in 1866. Among his published papers are "Thermal Effects of Fluids in Motion," "The Mathematical Theory of Elasticity," and "The Rigidity of the Earth." A volume of his papers on electrostatics and magnetism appeared in 1872.

**THOMSON, Thomas,** a British chemist, born at Crief, Perthshire, April 12, 1773, died at Kilmun, Argyshire, July 2, 1852. He was educated at the university of St. Andrews and at Edinburgh, and in 1796 became a contributor to the "Encyclopædia Britannica," his chemical articles in which formed the basis of his "System of Chemistry" (4 vols. 8vo, 1802). He was one of the first to suggest the use of chemical symbols, and among the first to elucidate the atomic theory of Dalton. In 1810 he published the "Elements of Chemistry" (8vo); in 1812, the "History of the Royal Society of London" (4to); and in 1818, "Travels in Sweden," which country he had visited in the previous year. In 1813 he went to London and commenced the "Annals of Philosophy," which he edited till 1822. In 1817 he was chosen lecturer at the university of Glasgow, and in 1818 was made professor of chemistry. His other works are: "An Attempt to Establish

the First Principles of Chemistry by Experiment" (2 vols., 1825); "The History of Chemistry" (2 vols., 1830-31); "Outlines of Mineralogy and Geology" (2 vols., 1836); and "Brewing and Distillation" (1849).—His son THOMAS, superintendent of the East India company's botanic gardens at Calcutta, has published an account of his travels in the western Himalaya and Thibet (8vo, 1852).

**THOMSON, WILLIAM**, an English clergyman, born in Whitehaven, Feb. 11, 1819. He was educated at Queen's college, Oxford, of which he was successively fellow, tutor, and provost. He was ordained in 1842, became select preacher at Oxford in 1846, Bampton lecturer in 1853, rector of All Souls, Marylebone, in 1855, preacher of Lincoln's Inn in 1858, bishop of Gloucester and Bristol in 1861, and archbishop of York in 1868. He has published "The Atoning Work of Christ" (London, 1853); "Outline of the Necessary Laws of Thought," a text book in several English and American colleges (1842; 9th ed., 1868); "Life in the Light of God's Word" (1867); "Limits of Philosophical Inquiry" (1868); and sermons, pastoral letters, and lectures.

**THOR**, in Scandinavian mythology, the first born of Odin and Frigga, the bravest and boldest of all the gods. He directed the winds and the seasons; agriculture and the family relations were under his special care; and, unlike Odin, he was opposed to war among men. In the Eddas he appears as the champion of gods and men, destroying monsters and giants with his bolts of thunder. A terrible hammer was hurled at his victim, and after the blow was dealt the weapon returned to his hand. His waist was bound with a girdle which forever renewed the strength he spent in battle. Thor has been compared with Hercules, Jupiter, and the old Saxon deity Irmin. The fifth day of the week has from him received its name, Thursday.

**THORAX** (Gr. *θώραξ*), the chest, or upper part of the trunk of the body, situated between the neck and the abdomen. The osseous framework of the thorax consists of the 12 dorsal vertebræ behind, the sternum or breast bone in front, and the ribs upon each side. The spaces between the ribs are occupied by the intercostal muscles, external and internal. The floor or inferior wall of the thorax is constituted by the diaphragm, a vaulted muscular sheet, with a central tendinous expansion, the convexity of which looks upward toward the chest, while its concavity looks downward toward the abdomen. The general form of the thorax is conical, with a broad base below, and presenting at its upper extremity a comparatively narrow and nearly circular opening, bounded on each side by the curved borders of the first pair of ribs, through which the trachea, œsophagus, nerves, and blood vessels pass from the neck into the chest, or *vice versa*. The framework of the chest thus constituted has a considerable degree of elasticity, owing

to the curved form of the ribs themselves, and to the fact that they are articulated with the sternum by elastic cartilages of variable length, oblique in position. Owing to the mobility of the ribs at their vertebral articulations, they are capable of being rotated outward and elevated by the action of the intercostal muscles, and of thus expanding the cavity of the chest laterally. The expansion also takes place at the same time in an antero-posterior direction, since the sternum itself is elevated by the movement of the ribs and carried further away from the spinal column; in this way is produced the alternate rising and falling of the walls of the chest during respiration. By the contraction of the diaphragm the central tendon of this muscle is drawn downward at the moment of inspiration, thus also expanding the chest vertically.—The cavity of the thorax has a general conoidal form, corresponding with

Cavity of the Thorax in Man, opened anteriorly, showing the internal organs. *a, b, c.* Upper, middle, and lower lobes of the right lung. *d, e.* Upper and lower lobes of the left lung. *f.* Heart. *g.* Pulmonary artery. *h.* Pulmonary vein. *i.* Aorta. *k.* Superior vena cava. *l.* Upper surface of the diaphragm. *m.* Lower extremity of the sternum. *n.* Trachea.

its external configuration. It is partially divided, however, into lateral halves by the forward projection of the bodies of the dorsal vertebræ, leaving on each side of the spinal column a tolerably deep rounded groove or furrow. The principal organs contained in the cavity of the thorax are the heart, lungs, and great blood vessels. The heart is situated nearly in the median line, with its point directed downward and toward the left side, and the lower part of its inferior and posterior surface resting upon the central tendon of the diaphragm. The superior and inferior venæ cavae, the aorta, the pulmonary artery, and the pulmonary veins are connected with the base of the heart, mostly about the level of the junction of the third costal cartilage with the sternum. The lungs are on each side, moulded to the form of the cavity in which they are contained, and

partly lapping over the heart and great vessels in an anterior view. The trachea enters the cavity of the chest behind the superior vena cava and the arch of the aorta, and the esophagus is situated still further backward, in immediate contact with the spinal column. The phrenic nerve passes down on each side, between the subclavian artery and vein, in front of the root of the lung, between the pleura and pericardium, to be distributed to the muscular tissue of the diaphragm. The pneumogastric nerves descend behind the roots of the lungs, where they give off their pulmonary branches, and then accompany the esophagus through an opening in the diaphragm to the stomach. The thoracic portion of the great sympathetic nerve is on each side of the spinal column, as a chain of ganglia, each ganglion resting upon the head of a rib, and connected by nervous filaments with those above and below.

**THOREAU, Henry David**, an American author, born in Concord, Mass., July 12, 1817, died there, May 6, 1862. He graduated at Harvard college in 1837, and after teaching school for a short time became a land surveyor. In this pursuit he worked no more than was necessary to gain the means for his simple wants, and devoted most of his time to reading, writing, pedestrian excursions, and study. Emerson says of him: "Few lives contain so many renunciations. He was bred to no profession; he never married; he lived alone; he never went to church; he never voted; he refused to pay a tax to the state; he ate no flesh, he drank no wine; he never knew the use of tobacco; and, though a naturalist, he used neither trap nor gun." In 1845 he built a small frame house on the shore of Walden pond, Concord, and lived in it alone for two years, working and studying. He published "A Week on the Concord and Merrimack Rivers" (Boston, 1849), and "Walden, or Life in the Woods" (1854). After his death were published "Excursions in Field and Forest," with a biographical sketch by R. W. Emerson (1863); "The Maine Woods" (1864); "Cape Cod" (1865); "Letters to Various Persons," with nine poems (1865); and "A Yankee in Canada," with anti-slavery and reform papers (1866).—See "Thoreau, the Poet-Naturalist," by William Ellery Channing (Boston, 1873).

**THORIUM**, or **Thorium**, a rare metal discovered in 1828 by Berzelius in a black mineral called thorite, found in a syenitic rock in Norway. It is obtained by reducing the chloride with potassium or sodium. It is a gray metallic powder having much resemblance to zirconium, and acquires a metallic lustre by pressure. Its specific gravity is 7.6 to 7.8; symbol, Th. It takes fire when heated considerably below redness, and burns with great brilliancy, forming thorina,  $\text{ThO}_2$ , a white substance of sp. gr. 9.402. Thorinic chloride,  $\text{ThCl}_3$ , is prepared by passing dry chlorine over a heated mixture of thorina and charcoal. It crystallizes in rectangular four-sided tables, which

are deliquescent and very soluble in water. Thorinic sulphate, with potassic sulphate, forms thorinic potassic sulphate,  $\text{K}_2\text{SO}_4 \cdot \text{ThSO}_4 \cdot \text{H}_2\text{O}$ , which is soluble in water, but is precipitated by a saturated solution of potassic sulphate. Thorinic sulphate is characterized by being precipitated by boiling its solution, which redissolves on cooling. Oxalic acid gives with salts of thorium a white insoluble oxalate of the metal.

**THORN**, a name used in combination for various spinescent plants, but by itself restricted to species of the genus *crataegus*, of the rose family. The genus belongs to that division of the family (tribe *pomeæ*) which includes *pyrus*, the apple, pear, &c., and differs from this chiefly in the structure of the fruit. About 65 species are described (which is probably many more than really exist), found in Europe, Asia, and North America, and a single one in the Andes of Columbia; they are shrubs, or sometimes small trees, and often armed with thorns, which are abortive or suppressed branches. The leaves are alternate, simple, often lobed, and in some species evergreen; the abundant flowers, usually in terminal clusters, though much smaller, closely resemble those of the apple in structure, are generally white, sometimes rose-colored, and fragrant; styles one to five; the usually red and sometimes edible fruit is a drupe rather than a pome; the carpels, instead of being parchment-like as in the apple, forming when ripe a hard, bony, one- to five-celled stone, or one to five distinct, bony, one-seeded stones. There are about a dozen species of thorn in the Atlantic states, three or four of which are peculiarly southern, and two naturalized; a few of the native species extend across the continent, and a small number are peculiar to the far west. In their wild state, as well as in cultivation, the species are much disposed to vary.—One of the most noticeable and finest of the native species is the cockspur thorn (*crataegus crus-galli*), which extends from Canada to Florida and west of the Mississippi. When well developed it is a small tree, 10 to 20 ft. high, with numerous nearly horizontal branches forming a round head; the sharp and slender thorns are 2 to 4 in. long, and often show their branch-like nature by bearing leaves when young; the obovate leaves taper to a wedge-shaped base, are serrate toward the apex, very thick, smooth, dark green, and shining above,  $1\frac{1}{2}$  to 2 in. long; the flowers, produced on spurs shorter than the thorns, are succeeded by bright red, nearly globular fruit, about half an inch in diameter. This produces in the wild state varieties differing much in their foliage, and its synonymes are numerous; there are also some garden varieties, one of them remarkably dwarf. It was introduced into England nearly 200 years ago, and is there valued as an ornamental shrub or small tree; experiments have been made with it here as a hedge plant, to which use it is perhaps better

adapted than any other native thorn, but it has the disadvantages common to plants of this genus mentioned under **HEDGE**. The hard close wood of this and other species takes a

Cockspur Thorn (*Crataegus crus-galli*).

fine polish, and serves for handles to hammers and other tools, but on account of its small size its use is limited. Among the most conspicuous of the native species is the Washington thorn (*C. cordata*), which grows from Virginia southward, but has been somewhat cultivated as a hedge plant further north; it grows 10 to 20 ft. high, and is very spiny; its broad leaves, sometimes slightly heart-shaped at base, are often three-lobed; the fruit, the size of peas, is bright red. The scarlet-fruited thorn (*C. coccinea*), with smooth, thin, roundish-ovate leaves, and coral-red but scarcely edible fruit, is very common. So also is the pear or black thorn (*C. tomentosa*), which has thickish ovate or obovate, sharply toothed leaves, downy when young, very large fragrant flowers, and globular or pear-shaped fruit three fourths of an inch across, scarlet or orange, and edible, having often a pleasant flavor; there are several varieties of this, one of which has its fruit dotted with white. The parsley-leaved thorn (*C. apiifolia*), distinguished by its much cut leaves, is found from Virginia southward. The summer haw (*C. astivalis*) of South Carolina, and growing southward and westward, is a small tree found on the margins of the pine-barren ponds; it has wedge-obovate, thick leaves, and globose, large, red fruit, which ripens in early summer, and, being quite juicy with a pleasant acid flavor, is much esteemed for making tarts and jellies. The remaining native species are only of interest to the botanist.—Among exotic thorns, the best known is the hawthorn (*C. oxyacantha*), also called white thorn, and in England May or May tree, and also quickset, from its being set to form a quick or living fence or hedge. The term haw is applied to the fruit of this and other thorns;

but being from the *A. S. hoga*, a fence or hedge, hawthorn really means a hedge thorn, and the origin of the name points to this use of it in very early times. The species is found throughout Europe, Siberia, and central Asia; and as it was early introduced into this country, it has become more or less naturalized in the older states. Its smooth leaves are wedge-shaped at the base and cut-lobed and toothed above; its abundant flowers appear in May, and are followed by ovoid, coral-red, rather small fruit. The varieties are numerous, the catalogues containing 80 or more, which differ from the normal form in the shape of the tree, some being very pendulous, in the character of the leaves, and in the form and color of the flowers; the bloom, usually white, varies from blush through pink and rose color up to a recently introduced scarlet, and there are double as well as single flowers of the white and various shades, so that a collection of the forms of this species alone would present a great variety. The Glastonbury thorn, near the abbey of that name in England, is a variety of hawthorn flowering twice a year; it blooms at the usual time, and also bears a crop of very early flowers, which open about Christmas. In England the hawthorn is the almost universal hedge plant, it being as well adapted to that climate as it is unfitted to ours; the early attempts at hedging in this country were, in imitation of the home practice, made with this plant; and the general

Hawthorn (*Crataegus oxyacantha*).

failure with it brought all hedging into disrepute. (See **HEDGE**.) The evergreen or pyracanth thorn (*C. pyracantha*), from the south of Europe, was distributed several years ago as a desirable hedge plant; it has shining, evergreen, mostly oblong leaves, about an inch long, with small clusters of flowers and brilliant red fruit; it has become naturalized near Washington and in some other localities; in a climate not more severe than that of Virginia it makes an excellent hedge. An accidental variety with white or yellowish fruit is (as is sometimes the case with varieties) more robust

than the type; this has proved perfectly hardy near New York in the most severe winters, and promises to be a valuable hedge plant.—The pyracanth thorn is readily multiplied from cuttings, but the hawthorn and our native species are mostly raised from seeds, which are very slow in germinating; the fruit is placed in what is called the "rot heap," where mixed with earth it is exposed to the weather for a year before sowing. Thorns from the seed are used as stocks upon which to graft the double and other desirable varieties, and some of our vigorous native species have been used as stocks for the pear; but there is no advantage in using these stocks, and unless the grafting is done below the surface of the soil the pear is apt to break away from the thorn.

**THORN**, a town of the kingdom and the province of Prussia, on the right bank of the Vistula, 52 m. S. W. of Marienwerder; pop. in 1871, 16,619. It has three Protestant and three Catholic churches, famous manufactories of gingerbread, and an important trade in corn and lumber. It is the birthplace of Copernicus, of whom there is a statue in the market place and a monument in the Catholic St. John's church. It is strongly fortified.—Thorn was founded about 1230 by the Teutonic knights. It joined the Hanse league, and in 1454 placed itself under the protection of Poland, to which it was confirmed by the peace with the order concluded there in 1466. In 1724 a riot between the students of the Protestant gymnasium and those of the Jesuit school led to a bloody persecution of the Protestant citizens. Thorn has repeatedly been besieged.

**THORN APPLE.** See *Datura*.

**THORNBURY**, George Walter, an English author, born in London in 1828. In 1845 he published a series of topographical and antiquarian papers in the "Bristol Journal." After 1858 the name George is omitted from his title pages. He has published "Lays and Legends, or Ballads of the New World" (London, 1851); "Monarchs of the Main, or Adventures of the Buccaneers" (1855); "Shakespeare's England," and "Art and Nature at Home and Abroad" (1856); "Legend of the Wandering Jew," and "Songs of the Cavaliers and Roundheads" (1857); "Every Man his Own Trumpeter," a novel founded on Montluc's memoirs (1858); "Life in Spain, Past and Present" (1859); "Turkish Life and Character" (1860); "British Artists from Hogarth to Turner" (2 vols. 8vo, 1860); "Ice-Bound," "Cross Country," and "Life of J. M. W. Turner, R. A." (1861); "True as Steel" (1863); "Wildfire" (1864); "Haunted London," and "Tales for the Marines" (1865); "Greatheart, a Cornish Novel" (1866); "Two Centuries of Song," a collection of *vers de société* (1867); "The Vicar's Courtship," and "Old Stories Retold" (1869); "A Tour round England" (1870); "Old and New London" (2 vols., 1873-4); and "Historical and Legendary Ballads and Songs," a collection of his previously published poems (1876).

**THORNHILL**, Sir James, an English painter, born in Weymouth in 1676, died there, May 4, 1784. He settled in London, and during the last 30 years of his life was employed on important works, including the eight pictures in chiaroscuro illustrating the history of St. Paul on the inner dome of St. Paul's cathedral, and the decorations at Kensington palace, Blenheim, and Greenwich hospital. In 1724 he opened an academy for drawing at his house. Hogarth was his pupil and son-in-law. He was knighted by George I., and represented Weymouth in parliament.

**THORNTON**, Bannell, an English author, born in London in 1724, died May 9, 1768. He was educated at Oxford, and in conjunction with George Colman the elder began a periodical, "The Connoisseur," which lasted from January, 1754, to September, 1756. With Colman also he was one of the original proprietors of "The St. James's Chronicle." In 1762 he published "An Ode on St. Cecilia's Day, adapted to the antient British Music, viz., the Salt-box, the Jews-harp, the Marrow-bones and Oleavers, the Hum-strum or Hurdy-gurdy, &c., with an Introduction giving an Account of those truly British Instruments" (4to, London); the ode was set to music by Dr. Burney, and performed on the instruments named with great success. In conjunction with Colman and Richard Warner he published "The Comedies of Plautus, translated into familiar Blank Verse" (2 vols., 1767), of which he translated "Amphitryon," "The Braggart Captain," "The Treasure," "The Miser," and "The Shipwreck." In 1768 he published "The Battle of the Wiga, an additional Canto to Dr. Garth's Poem of the Dispensary" (4to).

**THORNTON**, Matthew, a signer of the Declaration of Independence, born in Ireland in 1714, died in Newburyport, Mass., June 24, 1808. His father emigrated to America about 1717. The son was educated at Worcester, Mass., studied medicine, and commenced practice at Londonderry, N. H. In 1745, as a surgeon, he joined a New Hampshire division of 500 men in the expedition against Louisburg. At the beginning of the revolutionary war Dr. Thornton was a colonel in the militia. When a provincial convention was called, he was chosen its president; but he was immediately appointed to represent New Hampshire in the congress, and was permitted to sign the Declaration of Independence after taking his seat in September, 1776. Subsequently he was chief justice of the court of common pleas in New Hampshire, and later a judge of the superior court. He removed from Londonderry to Exeter, and finally fixed his residence at Merrimack, where he purchased a large estate.

**THORNWELL**, James Benley, an American clergyman, born in Marlborough district, S. C., in 1811, died in Charlotte, N. C., Aug. 1, 1862. He graduated at the South Carolina college in 1829, studied theology, and commenced preaching as a Presbyterian minister to the Waxhaw

church. In 1836 he was elected professor of logic and belles-lettres in the South Carolina college, and in 1838 became pastor of the Presbyterian church in Columbia. In 1840 he accepted the professorship of the evidences of Christianity and the chaplaincy of the college, and in May, 1852, took charge of the Glebe street church, Charleston. In December, 1852, he was elected president of the college, and in 1856 resigned to take a professorship in the Presbyterian theological seminary at Columbia. He published "Arguments of Romanists Discussed and Refuted" (New York, 1845); "Discourses on Truth" (1854); "On the Rights and Duties of Masters," and "The State of the Country" (1861); and numerous controversial articles in the "Southern Presbyterian Review," defending slavery and secession. His collected works have been edited by the Rev. John B. Adger (2 vols. 8vo, Richmond, 1874).

**THORNYCROFT, Mary (FRANCIS)**, an English sculptress, born at Thornham, Norfolk, in 1814. She was a pupil of her father, John Francis (1780-1861), who attained great eminence in London as a portrait sculptor, and executed busts of Queen Victoria, Prince Albert, Wellington, and many of the statesmen of his time. In 1840 she married Mr. Thornycroft, also a pupil of her father, and in 1842 accompanied him to Rome, where she received instructions from Thorwaldsen and Gibson. After her return in 1848 she was employed to execute statues of four of the royal children in the character of the four seasons. Her works include "The Flower Girl," "Sappho," "Sleeping Child," and "Girl Skipping."

**THOROUGH BASS**, the art by which harmony is superadded to any proposed bass, such harmonies being indicated by figures placed under the bass notes. The term is also used like counterpoint as synonymous with the science of harmony. (See *MUSIC*, vol. xii., p. 81.)

**THOROUGHWORT.** See *BONESSET*.

**THORPE, Benjamin**, an English philologist, born about 1808, died at Chiswick, July 18, 1870. He devoted himself to the study of Anglo-Saxon, translated the Anglo-Saxon grammar of Rask, superintended a series of editions of Anglo-Saxon works, including the metrical paraphrase of the Bible by Cædmon (1832), and published *Analecta Anglo-Saxonica* (1834); "The Anglo-Saxon Version of the Story of Apollonius" (1834); *Libri Psalmorum Versio Antiqua Latina, cum Paraphrasi Anglo-Saxonica* (1835); the great collection entitled "Ancient Laws and Institutes of England, with a Compendious Glossary," &c. (1840); *Codex Exoniensis* (1842); "Northern Mythology" (3 vols., 1851-'3), a critical collection of the legends of Scandinavia and northern Germany; "The Anglo-Saxon Chronicle" (2 vols. 8vo, 1861); and *Diplomaticum Anglicum Ævi Saxonici*, a collection of English charters (1865).

**THORWALDSEN, Bertel**, a Danish sculptor, born at sea between Iceland and Denmark, Nov.

19, 1770, died in Copenhagen, March 24, 1844. He was the son of an Icelandic, who was a wood carver, and was christened Bartholomæus, but was called by the diminutive Bertel, which the Italians turned into Alberto. At the age of 11 he entered the free school of the academy of arts in Copenhagen. At 17 he gained the silver medal of the academy; at 20 the small gold medal for his "Heliodorus driven from the Temple;" and in 1798 the grand prize, which entitled him to a small stipend for studying abroad. For several years after his arrival in Rome (March 8, 1797), his progress, owing to illness and his own diffidence, received no adequate recognition. He was preparing in 1803 to return to Denmark, when his model of "Jason bearing the Golden Fleece" attracted the notice of Thomas Hope, who offered him a liberal sum for the execution of the statue in marble, which reached England only in 1824. His earliest efforts reflected the idealism of classic art, and his Mars, Mercury, Ganymede, the Graces, Venus, Cupid and Psyche, Hector and Priam, and "Dance of the Muses on Mount Helicon" are among the best modern imitations of the antique. A more important work was the magnificent bass relief of the "Triumphal Entry of Alexander into Babylon," the plaster cast of which was completed in 1812 by order of Napoleon, for the Quirinal. Two copies in marble are in existence, one of which is in the palace of Christiansborg, Copenhagen. As Thorwaldsen gained in confidence and executive power, he rose above the mere imitation of Greek sculpture, and devoted himself to original works. In 1819 he made a brief visit to Copenhagen. His progress thither through Italy and Germany was one continuous ovation, and on arriving at his native city he was escorted in triumph to apartments prepared for him in the royal palace of Charlottenborg. Returning to Rome in 1820, he began the series of religious works which stamp him as one of the regenerators of sculpture. Among these was his colossal group of "Christ and the Twelve Apostles," now in the cathedral church of Copenhagen. In the same church are his statues of the four great prophets and many fine bass reliefs, and the exterior is adorned by his frieze of "Christ bearing the Cross," and by a group in alto rilievo representing the "Preaching of St. John," which fills the pediment. He also executed seated statues of Galileo, of Copernicus, in Warsaw, and of Byron, in Trinity college library, Cambridge; a monument to Pius VII.; and a vast number of other works. His largest single work is the colossal lion near Lucerne, Switzerland, commemorating the Swiss guards who fell in defending the Tuileries, Aug. 10, 1793; and among his statues in bronze are those of Schiller at Stuttgart and Gutenberg at Mentz. In 1838 he returned to Copenhagen in a frigate furnished him by the government, and was lodged in the royal palace. He died suddenly

of disease of the heart, just after he had taken his seat in the theatre. He was engaged until within a few hours of his death upon a bust of Luther, which was left unfinished. He was a man of much modesty, generosity, and amiability. As a sculptor of bass relief he surpassed any of his contemporaries; and some of his smaller works in this department, as the "Day" and "Night," modelled in 1815 at a single sitting, display a fertile vein of poetic imagination and executive refinement. In other works of the class he neglected the execution for the purpose of attaining vigor and strength. His entire collection of works of art, and the bulk of his large personal property, were bequeathed to the city of Copenhagen for establishing and supporting the celebrated museum containing his mausoleum and marble or plaster copies of all his works, of which Holst published 120 lithographs in his *Musée Thorwaldsen* (Copenhagen, 1851). Eugène Plon established in 1874 a Thorwaldsen museum at the Louvre.—See Thieler's various works on Thorwaldsen, including his life collated from his autobiography (German, Leipsic, 1852-'6; English translation by the Rev. M. R. Barnard, London, 1865), and Eugène Plon's *Thorwaldsen, sa vie et son œuvre* (Paris, 1867; English translation by Mrs. Cashel Hoey, London, 1874, and by Miss I. M. Luyster, Boston, 1874).

**THOU, Jacques Auguste de** (Lat. THUANUS), a French historian, born in Paris, Oct. 8, 1558, died May 7, 1617. He was the son of a first president of the parliament of Paris, studied law at home and in Italy, and was early engaged in diplomatic and judicial employments. In 1588 he was one of the deputies to the states general at Blois. He aided in effecting a reconciliation between Henry III. and Henry of Navarre, and went to Germany and Italy to procure men and money for them. Henry IV. appointed him grand master of the royal library, and in 1594 *président à mortier* of the parliament of Paris. He was one of the framers of the edict of Nantes, and supported the rights of the Gallican church by preventing the adoption of several decrees of the council of Trent. On the death of Henry IV. he was appointed one of the directors of finance. His *Historia sui Temporis* (completed from his materials by Père Dupuy and Nicolas Rigault in a 7th ed., 1620) embraces the period from 1543 to 1607, in 138 books. The only complete edition of his works is that of S. Buckley and T. Carte (7 vols. fol., London, 1738), including besides the above his autobiography, letters, and various essays, with an appendix by Rigault continuing the history to the death of Henry IV. A French translation appeared in 1784, in 16 vols. 4to, and a new edition of his autobiography in French, by Masson, in 1838. De Thou also left some Latin poems: *Hieracosophion, sive de Re Accipitraria Libri III.* (4to, 1584); *Pœmata Sacra* (12mo, 1599); and *Posteritatis, &c.* (12mo, 1678).—See "Life of Thuanus, with some Ac-

count of his Writings," by the Rev. John Colinson (London, 1807), and *Discours sur la vie et les ouvrages de J. A. de Thou*, by Philartète Charles (Paris, 1824).—His son, FRANÇOIS AUGUSTE, who succeeded him in the royal library, was a friend of Cinq-Mars, and was executed with him, Sept. 12, 1642.

**THOUARS.** See DU PETIT-THOUARS.

**THRACE**, in ancient geography, originally that part of modern Turkey in Europe lying between the Danube, the Black sea, the sea of Marmora, the Grecian archipelago, the Struma, and a line, not well defined, connecting that river with the Danube. In later times that part of Thrace which lay between the rivers Strymon (now Struma) and Nestus (Kara-su) was annexed to Macedonia by Philip, and the country N. of the Hæmus (Balkan) was made by the Romans a separate province under the name of Mœsia. Thrace, in the narrowest sense, was bounded N. by the Hæmus, E. by the Euxine, S. E. and S. by the Thracian Bosphorus, the Propontis, the Hellespont, and the Ægean sea, and W. by the Nestus. Two offshoots of the Hæmus, the Rhodope (Despoto Dag), E. of the Nestus, and a parallel range near the Euxine, traversed it in a S. E. direction. It was watered, besides the Nestus, by the Hebrus (Maritza) and its affluents the Artiscus (Tundja), Agrianes (Erkeneh), and others. The principal towns were Apollonia and Salmydessus on the Euxine; Byzantium (Constantinople) on the Bosphorus; Selymbria and Perinthus or Heraclea (Erekli) on the Propontis; Callipolis (Gallipoli) and Sestos on the Hellespont, in the Thracian Chersonesus (peninsula of Gallipoli); Lysimachia, Ænos, Meseimbria, Maronea, and Abdera, on the Ægean; and Philippopolis, Hadrianopolis (Adrianople), and Trajanopolis, on the Hebrus. The towns on the coast were all Greek settlements. The district between the Strymon and Nestus, called Macedonia Adjuncta, contained Neapolis, Philippi, and Amphipolis. In the times of Herodotus and Thucydides, Thrace, in the wider sense, was peopled by numerous tribes, probably Goths and Scythians, as Getæ, Treres, Odrysæ, Triballi, Daci, and Mœsi. At an early period they seem to have greatly influenced the culture of the Greeks, especially their mythology and religious rites. They are described as powerful, warlike, and cruel. They worshipped deities identified with Mars, Bacchus, and Diana, and had an oracle of Bacchus on a lofty summit of Rhodope. Orpheus, Linus, Musæus, and Eumolpus are said to have been Thracians. We find fragments of the Thracian race also in parts of Asia Minor and central Greece.—The Thracians are said to have been conquered by the Teucrians and Mysians. They were subdued by the Persians under Darius, but recovered their freedom after the reverses of Xerxes. Their most powerful native rulers were Sitalces, king of the Odrysæ, who fell in battle against the Triballi in 424 B. C., and his nephew Seuthæ, after

whose death the Thracian kingdom was split up in parts. Philip of Macedon conquered the greater part of it, and after the death of Alexander it was ruled by Lysimachus. It was subsequently annexed to Macedonia, and finally, with the latter, to the Roman dominions, though it long continued to be governed by native chiefs. After the division of the Roman empire it shared the fate of the eastern part. Its main parts now form the vilayet of Edirneh (Adrianople). (See *ROUMELIA*.)

**THRALE.** See *PIOZZI*.

**THRASHER.** See *THRUSH*.

**THRASYBULUS**, an Athenian general, attached to the democratic party, died about the close of 390 B. C. In 411 he was in command of an Athenian galley in the fleet at Samos, and joined the opponents of the oligarchical government of the 400. He was soon after made a general by an assembly in the camp, and procured the pardon and recall of Alcibiades. At the battle of Cynossema he commanded the right wing, and secured the victory by a sudden attack upon the Peloponnesians. In 407, with a fleet of 30 ships, he reduced most of the revolted cities on the coast of Thrace to submission, and about the same time was with Alcibiades elected one of the new generals. Banished on the establishment of the thirty tyrants, he seized with the aid of some Thebans the fortress of Phyle, and with 1,000 men occupied Piræus. From this place he carried on a brisk warfare against the thirty, and the ten who succeeded them, and finally delivered Athens and restored the democratic government (403). In 395 he led an army to the assistance of the Thebans, then menaced by Sparta, and in 390 was sent with 40 ships to aid the Rhodians against Telentias, restored the Athenian interest in Byzantium, secured several new alliances, and reduced Methymna and other towns in Lesbos. Afterward sailing south, he anchored in the Eurymedon, near Aspendus in Cilicia, when the inhabitants, exasperated by some act of his soldiers, killed him in the night.

**THRASYMENUS**, or *Trasimenus*, Lake. See *PERUGIA*, and *HANNIBAL*.

**THREAD WORM.** See *ENTOZOA*, vol. vi., p. 670.

**THREATENING LETTERS**, sent to persons for the purpose of extorting money, have been said to constitute a misdemeanor or criminal offence at common law. Blackstone says that threatening by letter (even without demand) to kill any of the king's subjects or to fire their houses, &c., was made high treason by a statute of Henry VIII.; and though this is no longer the law, the offence is punishable severely under existing statutes. In many of the United States there are statutory provisions, punishing with great severity an attempt to extort money by means of a threatening letter. It may be said generally that a threat, to be indictable, must be such as might naturally overcome a man of ordinary firmness and sagacity; and

the money demanded under the threat must be money to which the sender of the letter has no right. In England, it would seem to be an offence at law to post up, on a placard or otherwise, a threatening notice.

**THREE RIVERS** (Fr. *Trois Rivières*), a city and port of entry of the province of Quebec, Canada, on the N. bank of the river St. Lawrence, at the mouth of the St. Maurice, 62 m. S. W. of the city of Quebec and 80 m. N. E. of Montreal; pop. in 1861, 6,058; in 1871, 7,570. It is connected by ferry with a branch of the Grand Trunk railway on the opposite bank of the St. Lawrence. The chief trade is in lumber, which is shipped in large quantities to South America, the West Indies, England, and the United States. The value of imports for the year ending June 30, 1874, was \$82,097; of exports, \$159,451. An additional element of prosperity is the manufacture of iron wares, for which the St. Maurice forges, 3 m. distant, are noted. The city contains two branch banks, a college, an English academy, an Ursuline convent and school, several other schools, a tri-weekly and a semi-weekly newspaper (both French), a Roman Catholic cathedral and parish church, and Episcopal, Presbyterian, and Wesleyan Methodist churches. The streets are lighted with gas.—Three Rivers was founded in 1618. With the parish of the same name it forms an electoral district for parliamentary purposes, having an area of 17½ sq. m. and 8,414 inhabitants in 1871.

**THRESHER.** See *SHARK*, vol. xiv., p. 829.

**THRESHING MACHINE**, a machine for threshing and separating grain from the straw. The threshing floor of the ancients was a flat surface of ground covered with clay rolled smooth and hard. Sheaves of grain were spread evenly on this floor, and cattle driven over it until the grain was beaten out by the constant tramping upon it. The Egyptians usually muzzled the ox while threshing, and the Greeks are said by Ælian to have had the filthy practice of besmearing the mouths of animals with dung to prevent their eating the grain. The flail, which is yet in common use by small farmers, is a very ancient invention. Planks or timbers stuck over with pieces of flint or hard wooden pegs were used to some extent, but answered no good purpose. Michael Menzies of Scotland is supposed to have been the first inventor of a machine for threshing, which was merely an adaptation of suitable mechanism to drive a large number of flails by water power. Though unsuccessful in practice, this machine attracted considerable attention. In 1758 a Stirlingshire farmer named Leckie invented a rotary machine which consisted of a set of cross arms attached to a horizontal shaft, and the whole enclosed in a cylindrical case. It proved tolerably efficient in threshing oats, but was not adapted to wheat, as it knocked off the entire head from the straw without separating the kernels. Mr. Leckie having demonstrated the superiority of

a rotary motion for this purpose, it was an easy matter to remedy the defects of his machine and perfect the invention. In 1786 Andrew Meikle, a Scotchman, made an improvement on Leckie's machine by substituting a drum or cylinder with beaters attached to the circumference. He also applied rollers, connected by suitable mechanism to the driving gear, for feeding in the straw. When operated, the drum was set in rapid motion by water or other power; the sheaves of grain, unbound and placed between the rollers, were fed in; and the beaters, revolving with great velocity on the periphery of the drum, beat out the grain from the heads and partially separated it from the straw. A patent was procured in Great Britain in 1788, when Mr. Meikle constructed the first working machine, and added many new improvements, among which was the attachment of a fan mill, by which the grain was separated and cleaned from both straw and chaff. Though an invention of vast importance, saving annually millions of dollars in manual labor, and immensely increasing the product of grain throughout the civilized world, the simplicity of the threshing machine and the perfection of Meikle's inventions left little room for great modern improvements. Meikle's, with some modifications, was the first form of drum machine used in the United States; but although the beater drum is still used in Great Britain, it has long been replaced here by the spiked drum, which runs at a higher speed. This form of machine consists principally of a concave bed made of heavy plank lined with iron spikes arranged spirally, into which the drum, also armed with spirally disposed spikes, revolves. Such machines are capable of threshing 800 bushels of oats and over 100 of wheat in 10 hours. Most modern threshing machines have grain separators attached, by which the grain is winnowed by a revolving fan, and also elevators which are long endless aprons moved on rollers, by means of which the straw is taken up into a mow or on to a stack. Numerous machines of this kind are employed in the United States, es-

Geiser's Threshing Machine.

pecially in the Mississippi and Ohio region. In many places where the farms are not large, it is the practice to employ threshers who move their machines, which are on wheels like those of a wagon, from place to place.

One of these machines, patented by Peter Geiser, is represented in the engraving. M is the feeding board, and I the toothed drum, which throws the straw and threshed grain on to an inclined plane between I and B. Between B and C there is a rack, through which the grain falls, while the straw is moved forward on to the elevator N by means of a reciprocating rake. The grain falls back on an inclined plane to E, thence down over the fluted rollers E and F, where, receiving the air blast from the revolving fan H, the chaff is blown away, the grain passing down into receptacles below. Lighter grains and seeds of weeds are blown further, beyond a screen, and are carried along with some good grain by an elevator, back to the thresher at L, by which means all the good grain is saved.

**THROCKMORTON**, a N. W. county of Texas, drained by the Brazos river and its affluents; area, 900 sq. m.; returned as having no population in 1870. The surface is mostly broken and hilly, suited to grazing. In the south, near the Clear fork of the Brazos, is some good farming land.

**THROCKMORTON**, Sir *Nicholas*, an English statesman, born in London about 1513, died there, Feb. 12, 1571. He was page to the duke of Richmond till 1536, was afterward sewer to Henry VIII., and headed a troop at the siege of Boulogne. Distinguished in the Scottish campaign under Somerset, he was knighted, received valuable manors, and sat in parliament as member for Northampton. He was present at the death of Edward VI. in 1553, and, though a Protestant and aware of the movement in favor of Lady Jane Grey, favored the accession of Mary. He was arrested in 1554 as an accomplice in Sir Thomas Wyatt's rebellion, conducted his own defence, and was acquitted, but remanded to the tower on the ground that the verdict was contrary to law. He was released in 1555, lived for a time in France, and in 1556 privately visited the princess Elizabeth at Hatfield, after whose accession he was made successively chief butler of England and chamberlain of the exchequer. As ambassador to France from 1559 to 1563, he favored the policy of Cecil, and intrigued to foment the civil religious war. He was imprisoned in 1569 for favoring a marriage between Mary queen of Scots and the duke of Norfolk, and never regained Elizabeth's confidence.

**THROMBOSIS**. See BRAIN, DISEASES OF THE, vol. iii., p. 198.

**THRUSH**, the common name of a very large family of dentostrous birds, which contains some of the finest songsters in various parts of the world. The bill is of moderate length, rather stout, slightly convex and keeled above, with sharp and notched tip; at the base of the upper mandible on each side of the gape is a row of bristles much smaller than in the flycatchers; nostrils at the base of bill, partly protected by a membranous scale; wings tolerably long, broad, usually rounded at the end,

with the first quill very small; legs rather short and stout; tarsi compressed, covered in front by a single scale in the typical genus *turdus* (Linn.); tail moderate. The food consists of insects, worms, berries, and fruits, and sometimes mollusks; they move on the ground by hopping on both feet at once.—More than 100 species of the genus *turdus* are described, having the characters given above; they are found in all parts of the world, and are more or less migratory and shy; the nest is made of coarse grasses and mosses, usually lined with mud and soft plants, and is placed on bushes or trees; the eggs are five or six; the flesh is delicate. Several species have been already noticed under BLACKBIRD, FIELDFARE, and ROBIN. Among the American species is the wood thrush (*T. mustelinus*, Gmel.), 8 in. long and 13½ in. in alar extent; the form is stout, the tail nearly even, and the third and fourth quills the longest; the general color is rufous brown above, brightest on the head, and olivaceous on the tail; pure white below, with numerous blackish spots on breast and sides;

Wood Thrush (*Turdus mustelinus*).

legs yellow; bill brown, yellowish at base. It is found in the eastern United States to the Missouri river, and south to Guatemala. The notes are few, but powerful, clear, and mellow, rising and falling in gentle cadences; they are especially pleasing at sunset; the food consists of berries and small fruits, and insects; the flight is elevated. The eggs are uniform light blue; the young are easily raised from the egg, and they sing well in captivity. Several other species are described.—Of the European species, the largest is the missel thrush (*T. viscivorus*, Linn.), 11 in. long; it is light grayish brown above, the fore part of the head grayish and the rump shaded with ochrey yellow; secondary coverts and tail feathers tipped with grayish white; a cream-colored band from bill over eyes; below yellowish white, each feather tipped with a black spot, largest and transversely oblong on breast, smaller and triangular on neck. It frequents woods and copses, in small straggling flocks, and is shy and vigilant; it feeds chiefly on berries, especially those of the mistletoe (whence its common name). The song of the male resembles that of the black-

bird, and is heard as early as February, before the appearance of the leaves, and even during storms, whence its name of storm cock; it is

Song Thrush or Mavis (*Turdus musicus*).

very bold in spring. The eggs are four or five, 1½ by ¾ in., flesh-colored with irregular scattered spots of brownish red; two broods are generally raised in a season; it has been seen to carry off small birds to its nest to feed its young; the flesh is good. The song thrush, thrush, or mavis (*T. musicus*, Linn.) is 9 in. long, yellowish brown above, tinged with red on the head; secondary coverts tipped with reddish yellow; fore part of neck and breast yellowish, each feather terminated by a triangular brownish black spot; lower wing coverts reddish yellow. It frequents lightly wooded regions and gardens, in the latter destroying snails, which it obtains by breaking the shell against a stone; it is one of the finest of European songsters, singing from early spring to autumn, in the morning and evening, from the

Brown Thrasher (*Harporhynchus rufus*).

top of a bush or tree. Its flesh, especially in the beginning of winter when the food consists of snails and worms, is very fat and juicy.—

The brown thrush or thrasher is placed by Baird in the subfamily *minina* (with the cat bird and mocking bird), and genus *harporhynchus* (Cab.). This bird (*H. rufus*, Cab., or *T. rufus*, Linn.) is 11½ in. long and 18 in. in alar extent; brownish red above; below pale rufous white, thickly streaked with dark brown, and tinged anteriorly with reddish; two white bands on the wings; inner surface of wings and inner edge of primaries cinnamon; tail rufous. It is found over eastern North America to the Missouri, and to the high central plains; it is a constant resident in the southern states, and is almost as numerous as the robin; it migrates by day, singly, with a low and heavy flight. The song is prolonged, loud, varied, and melodious. The eggs are four to six, dull pale buff, with numerous brown dots; two broods are raised annually in the southern states; it breeds well in aviaries, and the young are raised like mocking birds, singing well and very active in confinement. It is a bold and powerful bird, chasing cats, dogs, and foxes, not afraid of hawks and snakes, and savagely fighting with its rivals in breeding time; both sexes incubate; the food consists of insects, berries, and fruits of all kinds. The water thrush (*seiturus Novboracensis*, Nutt.; *T. aquaticus*, Wils.) is placed by the most recent ornithologists in the family *sylicolidae* or warblers; it is 6½ in. long and 9½ in. in alar extent; olive brown above with a green shade; beneath pale sulphur yellow, brightest on the abdomen; the outer parts thickly streaked with olivaceous brown, and blackish on the breast. It is found throughout the eastern United States to the Missouri and south to Central America.

**THUANUS.** See THOU, JACQUES AUGUSTE DE.

**THUCYDIDES**, a Greek historian, born in Athens probably about 471 B. C., died about 400. He was the son of Olorus, and was probably connected with the family of Cimón. He tells us that he owned gold mines in Thrace, opposite Thasos. In 424 B. C. he was the commander of an Athenian squadron of seven ships, and charged with the general authority on the coast of Thrace; but as he failed to arrive in time to prevent the surrender of the important city of Amphipolis to the Spartan general Brasidas, he was condemned to exile, which continued 20 years. He spent much of this time in Thrace; but he must also have visited various parts of Greece, and it is certain from his own writings that he frequently visited the states under Lacedæmonian rule. He returned to Athens about the time the city was freed by Thrasybulus. The accounts of his death are uncertain. According to Pausanias, he was assassinated after his return; according to Plutarch, he was said to have been killed in Thrace, though his remains were carried to his native city. The work by which Thucydides is known is the history of the Peloponnesian war, a work equally distinguished by truthfulness, historical insight, excellence of narration, and masterly arrangement of

parts. The first edition was published by Aldus at Venice in 1502. Of the numerous later editions, the best are those of J. Bekker (8 vols., Berlin, 1821), Haack (2 vols. 8vo, Leipsic, 1820), Poppe (10 vols. 8vo, Leipsic, 1821-'88), Arnold (8 vols. 8vo, Oxford, 1830-'35), and Stahl's revised edition of Poppe (Leipsic, 1843-'75). There have been English versions by Nicolls (London, 1550), Hobbes, W. Smith (1753), Bloomfield (1829), Dale (1856), and Richard Crawley (1874).

**THUGS** (Hindi, *thugna*, to deceive), a sect of assassins in India, now exterminated by the British government. They roamed about the country in bands of from 30 to 300, and strangled to death such persons as they could decoy into their company. Their atrocious practices were not followed so much from impulses of plunder or malice as from religious motives. They were worshippers of the goddess Kali, who presided over impure love, sensual indulgence, and death. The members of the sect belonged to different Hindoo castes, and each had its functions. The bands were under a *junadar* or *sirdar*, who was the leader, and a *guru* or teacher. Its members were classified into spies, who were learners; stranglers; entrappers, who were sometimes women; and grave diggers. They usually assumed the dress of merchants or pilgrims, and often craved the protection of those whom they intended to destroy. Their usual instrument of destruction was the handkerchief, with which by a dexterous movement they strangled their victims. The spies having informed the band of the route, habits, and circumstances of their intended victims, the members travelled in such lines as to be near one another, and the entrappers by artful management attracted them to a spot remote from dwellings, where the stranglers executed their office; and having stripped them of whatever they possessed, the grave diggers buried them, with such precautions as generally to prevent discovery. The plunder was divided, one third to the widows and orphans of the sect, one third to the goddess Kali, and the remainder to the partners in the assassination. After a murder the Thugs who had committed it united in a sort of sacrament, eating consecrated sugar. Their deities were carefully consulted before going on their expeditions, and unless the omens were favorable the Thug would not go. Neither women nor old men were victims. Europeans were never killed, as there would have been more danger of detection. There were also bands of Mohammedan Thugs, of the sect of Mooltanees, and it is possible that at first the system of *thugges* originated with Mohammedan banditti, though it afterward became more a Hindoo than a Mohammedan practice, and the words used are of Sanskrit origin. Thugs were found in all parts of India. Attempts were made to exterminate these bands of murderers in several of the native states, even prior to the present century; but their

connection as a wide-spread religious fraternity remained unknown till 1829, during the administration of Lord William Bentinck, who appointed Capt. (afterward Sir William) Sleeman to break up the organization. This was successfully accomplished by the arrest of every known Thug or relative of a Thug in India; 8,266 such persons were apprehended prior to 1837. They were colonized at Jubbulpore into a trade settlement, where technical instruction was afforded them and their children. Their descendants are still under government supervision there, and the practice of thuggee has become extinct.—In 1836 the government published, for judicial purposes, “*Ramaseeana*, or a Vocabulary of the peculiar Language used by the Thugs,” by Capt. Sleeman. See also “*The Confessions of a Thug*,” by Meadows Taylor (London, 1858).

**THULE**, the name reported by the ancient navigator Pytheas, about the time of Alexander the Great, as that of the northernmost region of Europe. Strabo says that he gives no clue as to whether it is an island, or whether it is inhabited; and it is therefore probable that Pytheas did not visit Thule himself. Iceland is commonly supposed to be the land he referred to, as he says it was six days from the Orcaades (Orkney islands); yet there are other reasons which favor the view that Mainland, the largest of the Shetland group, or Jutland, or Norway, is meant.

**THUN**. L. A walled town of Switzerland, in the canton of Bern, on the Aar, about 1 m. from Lake Thun, and 16 m. S. E. of Bern; pop. about 4,700. Among the public buildings are the old Kyburg castle, the cathedral, the federal military academy, and the modern Gothic castle of Schadau. It is a summer resort of tourists to the Bernese Alps. **IL A** lake, 10 m. long, 2 m. wide, and 1,896 ft. above the sea. It connects at the S. E. end with Lake Brienz by the Aar, which again emerges from the N. W. end of Lake Thun, and the water of the Kander is carried into the lake through an artificial channel formed in 1714. The shores near the town of Thun are covered with fine villas and gardens. Near the S. W. shore are the two mountains Niesen and Stockhorn. A small steamer plies regularly.

**THUNBERG**, *Carl Peter*, a Swedish botanist, born in Jönköping, Nov. 11, 1748, died in Upsal, Aug. 8, 1828. He studied under Linnæus at Upsal, became surgeon in a Dutch ship in 1771, passed three winters at the cape of Good Hope, and between 1778 and 1779 resided principally in Java and Japan. He returned to Sweden in 1779, and was appointed in 1784 professor in the chair formerly occupied by Linnæus, which he retained until his death. His works include *Flora Japonica*, &c. (Leipsic, 1784); a general account of his travels under the title of *Rosa uti Europa, Africa, Asia* (4 vols., Upsal, 1788-'91), which was translated into German, English, and French; *Prodromus Plantarum Capensium* (1794-1800); *Icones*

*Plantarum Japonicarum* (1794-1806); *Flora Capensis* (1807-'13); and nearly 100 academical dissertations.

**THUNDER**. See **LIGHTNING**.

**THURGAU**, a N. E. canton of Switzerland, bounded N. and N. E. by the Rhine and the lake of Constance, separating it from Schaffhausen, Baden, Württemberg, and Bavaria, S. E. and S. by the canton of St. Gall, and W. by Zürich; area, 882 sq. m.; pop. in 1870, 98,300, nearly all Germans, of whom 23,454 were Roman Catholics. The surface is comparatively level, but numerous hills traverse the country in different directions, the height of which nowhere exceeds 1,000 ft. above the lake of Constance. The principal river is the Thur, which flows N. W. and W. through Thurgau and Zürich to the Rhine. The climate in the southwest is severe, but elsewhere temperate. The soil is not very productive. Fruit is extensively grown, and good wine is produced. About one fifth of the surface is covered with forest. Linen and cotton goods, ribbons, lace, hosiery, and canvas are manufactured. Numerous schools are established throughout the canton. The only language spoken is the German. The executive power is vested in a council (*kleiner Rath*) of seven, who hold office for six years. The grand council or legislature consists of one member for every 220 citizens. It is presided over by two *Landammanns*, chosen annually, and sends five members to the national council. Capital, Frauenfeld.

**THURINGIA** (Ger. *Thüringen*), a central region of Germany, between the Hartz mountains on the north and the Thuringian Forest on the south, the river Saale on the east and the Werra on the west, the principal parts belonging to the Prussian province of Saxony, to Saxe-Coburg-Gotha, Weimar-Eisenach, Schwarzburg-Sondershausen, and Schwarzburg-Rudolstadt. The Thuringians were allies of Attila in the middle of the 5th century. Their country was afterward subdued by the Franks and Saxons. The Franks ruled it for some centuries through dukes and margraves. Under the Saxon emperors several Thuringian counts or landgraves obtained a kind of semi-independence. Louis the Jumper, son of Louis the Bearded, warred against the emperor Henry IV. in the latter part of the 11th century, and several of his successors added to the possessions of the house. One of them, Hermann (1190-1216), is chiefly known as a patron of minnesingers. A long war of Thuringian succession was waged about the middle of the 13th century, the termination of which left the principal parts of the country in the possession of the margrave Henry of Meissen. Thuringia was now ruled by the Saxon house of Wettin, until, after various changes, the Saxon dominions were divided in 1485 between Ernest and Albert, the sons of Frederick the Mild, when Thuringia fell to the Ernestine line. (See **SAXONY**.)—The Thuringian Forest (Ger. *Thüringerwald*), which bounds

it S. W. and S., is a narrow and wooded mountain range, rising in some parts upward of 3,000 ft., and extending nearly 70 m., not including numerous northern offshoots toward the Hartz. In the southeast it approaches the Fichtelgebirge, and in the southwest the Rhön, from which it is separated by the valley of the Upper Werra. The inhabitants are chiefly engaged in mining, grazing, and manufactures. The territory covered or traversed by the Thuringian Forest is included in the Prussian province of Saxony, Saxe-Weimar-Eisenach, Meiningen-Hildburghausen, Saxe-Coburg-Gotha, Schwarzburg-Rudolstadt, Altenburg, and the Reuss principalities, all of which territories are called Thuringian in the wider sense.

**THURLOE, John**, an English statesman, born at Abbots Roding, Essex, in 1616, died in London, Feb. 21, 1668. He was called to the bar in 1647, and in 1652 became secretary to the council of state, and in 1653 secretary to the protector. In 1657 he was made a privy councillor, and in 1658 governor of the Charterhouse and chancellor of Glasgow university. While continuing to hold office under Richard Cromwell he was accused of offering his services to promote the restoration of Charles II., and was imprisoned in May and June, 1660. After his release he took no part in public affairs. His collection of state papers, with a number of private papers and letters, was edited, with a life of Thurloe, by Thomas Birch, D. D. (7 vols. fol., London, 1742.)

**THURLOW, Edward**, lord, an English statesman, born at Little Ashfield, near Stowmarket, Suffolk, in 1732, died in Brighton, Sept. 12, 1806. He was educated at Cambridge, was called to the bar in 1754, entered upon a lucrative practice, and was appointed king's counsel in 1761. In 1768 he was elected to parliament, in 1770 was appointed solicitor general, in 1771 attorney general, and in 1778, as a reward for his zealous advocacy of the government policy respecting America, he was made lord chancellor in Lord North's ministry, and raised to the peerage as Baron Thurlow. By command of the king he retained the office of lord chancellor in the Rockingham and Shelburne administrations, notwithstanding he was politically opposed to his coadjutors, and lost no opportunity to defeat their leading measures. This led to the withdrawal of Fox; and in the coalition ministry which succeeded, it was stipulated that Thurlow should not hold a seat. He still remained in confidential relations with the king, and on the accession of Pitt to power, in December, 1788, received again the great seal, which he held for more than eight years. He opposed certain measures of the cabinet, which led to his removal at the request of Pitt, whom he always disliked, and with the consent of the king. He was overbearing and passionate, a dictator rather than a debater in parliament, but an impressive and eloquent speaker.—His nephew and heir, **EDWARD HOVELL-THURLOW**, second

lord (1781–1829), published "*Ariadne, a Poem in three Parts*" (1814), "*Carmen Britannicum*" (1814), and several volumes of miscellaneous poems, including translations from Anacreon and Horace.

**THURN AND TAXIS**. See *Post*, vol. xiii., p. 748.

**THURSDAY**, the fifth day of the week, the *dies Jovis* of the Roman calendar, and sacred in the northern mythology to the thunderer Thor, from whom it is named. In German it is called *Donnerstag* (thunder day, originally Thunderer's day).

**THURSTON**, a S. W. county of Washington territory, bounded N. E. by the Nisqually river, and W. by the Coast range; area, 672 sq. m.; pop. in 1870, 2,246. Much of the surface is mountainous, but there are several rich valleys. An arm of Puget sound extends into the N. E. part, and it is drained by the Des Chutes river and other streams. The Pacific division of the Northern Pacific railroad passes through it. The chief productions in 1870 were 10,602 bushels of wheat, 1,778 of rye, 17,515 of oats, 18,375 of potatoes, 16,511 lbs. of wool, 40,425 of butter, and 8,013 tons of hay. There were 788 horses, 1,184 milch cows, 1,978 other cattle, 4,192 sheep, and 788 swine; 2 flour mills, 1 tannery, 1 currying establishment, and 8 saw mills. Capital, Olympia, which is also the capital of the territory.

**THYESTES**. See *ATREUS*.

**THYLACINE**, or *Pouched Wolf*, a marsupial animal of the dasyurine family, and genus *Thylacinus* (Temminck) or *peracyon* (Gray), peculiar to Tasmania; both of the generic names indicate the possession of the pouch. In this genus the dentition is: incisors  $\frac{3}{1}$ , the outer slightly the largest; canines  $\frac{1}{1}$ , large, simply conical, the upper separated from the incisors by a deep concavity in which the apex of the

Dog-headed Thylacine (*Thylacinus Harrisii*).

lower is received when the jaws are closed, in this differing from carnivora proper, in which the lower canines pass outside of the upper jaw; premolars  $\frac{3}{3}$ , separated from each other; molars  $\frac{1}{1}$ , with a large central cusp, and two smaller, one in front and the other behind it. The humerus has the inner condyle perforated, the hind feet have no in-

ner toe, and the marsupial bones are absent, represented only by fibro-cartilage; the female has a distinct pouch, with four mammae. Only one species is described, the dog-headed thylacine (*T. [P.] Harriessii*, Temm.), about the size of a young wolf, or 3½ ft. long, with a tail 20 in. additional, and a height at the shoulders of about 22 in.; the head is dog-shaped, with narrow and elongated muzzle; ears short, pointed, very broad at the base, and well covered with hair on both surfaces; eyes full and black, with a nictitating membrane; long black bristles on the upper lip, and a few on the cheeks and above the eyes; the claws stout, short, and brown, the bottoms of the feet with large, very rough pads. The fur is short and close, waved and slightly woolly; the general color is grayish brown, paler below, with 12 to 14 transverse black bands on the back, longest and widest posteriorly; pale around eyes, and edge of upper lip white; tail with short fur, with longer hairs at under side of apex; rusty red about the pouch; the legs are shorter in proportion than in the wolf, and the gait is semi-plantigrade. It is wild and shy, inhabiting the caverns and dismal glens of mountainous districts; inactive during the daytime, probably from imperfect vision, it preys at night upon the smaller marsupials; it is sometimes so large as to be a match for several dogs, and is one of the most formidable of Australasian quadrupeds; it is rare except in the most inaccessible regions. Among the fossil remains of the caves of Wellington valley, New South Wales, Prof. Owen has described parts of lower jaws of what he calls *T. spelæus*, differing from existing ones in their greater depth. In the secondary schists of Stonesfield has been discovered the genus *thylacotherium* (Owen), known by the lower jaw, which has six incisors, two moderate canines, six false and six true tricuspid molars; the *T. Prevostii* (Ouv.) was about the size of a rat. An allied genus from the same strata is *phascolotherium* (Broderip), somewhat larger.

**THYME**, low undershrubs or perennial herbs, of the genus *thymus* (Gr. *θύμος*, from *θεω*, to burn perfume, it having been used as incense), of the labiate or mint family. The wild or creeping thyme of northern Europe (*T. serpyllum*) is sparingly naturalized in the older states in old fields, and in some cases as a weed upon lawns; it is much branched and prostrate, forming low dense tufts a foot in diameter; its very small ovate leaves are fringed at the base with a few long hairs, and its purplish flowers are crowded in whorls at the ends of the branches. This is sometimes cultivated as an aromatic herb, but not so much so as the garden thyme (*T. vulgaris*), from southern Europe, which differs from the preceding in having a more erect and bushy habit, paler leaves, and flowers in shorter clusters; there are varieties of this, both the broad-leaved and narrow-leaved being known in kitchen gardens, and

the variegated or golden thyme, which has each leaf distinctly marked with yellow, is a pleasing ornamental plant. Lemon thyme,

Wild Thyme (*Thymus serpyllum*).

much esteemed by some for its peculiar flavor, is *T. citriodorus*. The thyme in general use is *T. vulgaris*, the foliage of which is highly aromatic and much used for flavoring stuffing and other cooking; its properties are due to an essential oil, the oil of thyme, which is used as an external stimulant, in liniments, especially in veterinary medicine; it contains a liquid and a solid oil or camphor, which may be separated by fractional distillation.

**THYMUS GLAND** (Gr. *θύμος*), a double vascular or ductless gland, situated, in the human subject, in the upper part of the anterior media-

Transverse Section of an injected Lobule of the Thymus of a Child, magnified 80 diameters. *a.* Membrane of the lobule. *b.* Membrane of the gland follicles. *c.* Cavity of the lobule from which the larger vessels branch out into the corpuscles, on the surface of which they terminate, occasionally forming loops.

tinum, extending in childhood from the thyroid gland to the anterior surface of the pericardium, but becoming atrophied after the age of puberty. It is divided into two lateral portions, right and left, which are in reality distinct from each other, being connected only by areolar tissue. Each lateral portion is gland-like in structure, being divided into a number of lobules, from a sixth to a third of an inch in diameter, and irregularly rounded and flattened. In its interior is a central cavity, having the form in some cases, according to Kölliker, of a cylindrical canal, communicating with that of the separate lobules, and containing a grayish white or milky-looking fluid, of a slightly acid reaction. Each lobule is invested on its exterior by a thin, nearly homogeneous membrane, which sends partitions a short distance into its substance, dividing it in this way externally into rounded masses or gland follicles, each about  $\frac{1}{16}$  of an inch in diameter, giving the outer surface of the lobule a granular appearance. The solid substance of the lobule consists of a soft homogeneous material, containing nucleated cells and an abundance of free nuclei, and penetrated throughout by capillary blood vessels, which radiate from the wall of the central cavity and terminate in vascular loops toward its external portion. Its central cavity has no excretory duct, and its secreted product, if such there be, must be taken up and carried away by the veins or the lymphatics. The thymus gland is highly developed during the latter part of intra-uterine life, and at the time of birth, in man, weighs rather more than half an ounce. It continues to enlarge until the age of two years, at which time its growth ceases. It begins to diminish about the 10th year, but is still usually perceptible, and sometimes well developed, at the age of 20. By the 40th year it has entirely disappeared. It is about the same in the anthropoid apes as in man, and is remarkably developed and may be well studied in the calf, in which, and in the lamb, it is called the sweetbread, and is a delicate article of food; it exists in mammals, birds, and most reptiles, but not in the larvæ of batrachians, the perennibranchiate amphibians, or fishes.—The precise function of the thymus gland is unknown. It undoubtedly serves, like the other ductless glands, to accomplish some change in the blood circulating through its tissue, which is essential to the proper nourishment of the body during intra-uterine life, infancy, and childhood.

**THYROID GLAND** (Gr. *θυρεός*, a shield, and *είδος*, form), one of the vascular or ductless glands, situated on the anterior and lower part of the larynx, in front of the upper rings of the trachea; so called from its being situated in front of the thyroid or shield-like cartilage of the larynx. It is composed of two elongated ovoid lobes, flattened from before backward, united or separate, but generally connected by a transverse portion; it is covered by the muscles of the front of the neck. The

tissue is tolerably firm, brownish and yellowish red, formed of lobes and lobules, consisting essentially of an aggregation of closed gland follicles imbedded in condensed areolar tissue; these contain a small amount of a fatty albuminous fluid, and do not communicate with any common reservoir; among the follicles are nucleated corpuscles or epithelial cells; it receives four arteries from the subclavians and the carotids, nerves from the pneumogastric and the sympathetic, and lymphatics communicating with the glands of the neck. The vascular supply is great, and forms a very minute capillary plexus on the membrane of the follicles; like other ductless glands (see **THYMUS GLAND**), it is relatively larger in intra-uterine existence and in infancy than in after life. Its products are probably discharged into the venous blood, and serve for the elaboration of the circulating fluid. It is usually larger in females than in males; it is found in all mammals, birds, and reptiles, probably in the batrachians, and perhaps also in fishes. The organ may be inflamed, with suppuration, and variously enlarged. In the adult it is sometimes abnormally enlarged, forming the disease known as goitre or bronchocele, which is itself often an accompaniment of cretinism. (See **GOITRE**.)

**TIAGUANACO**, or *Tiahuanaco*. See **TITICACA**.

**TIARA** (Gr.), a species of high hat anciently worn by many eastern nations. Those of kings and priests were encircled by a sort of crown, whence the term tiara has been applied to the triple crown worn by the popes, which in turn

FIG. 1.—Persian Tiara.

FIG. 2.—Assyrian Tiara.

bears a striking resemblance to the Persian royal tiaras and to those of the Assyrian kings, represented on the slabs at Nineveh. It is uncertain when the popes assumed the tiara. It was called *regnum*, or emblem of royalty, to distinguish it from the mitre. Pope Innocent III., in his sermon on St. Sylvester, says that the bishop of Rome uses the mitre everywhere and at all times, because his episcopal jurisdiction is universal, whereas he only uses the *regnum* or tiara occasionally and in his own dominions. The papal tiara was at first a conical cap, topped with a small round ball, and wreathed about the forehead with a crown of gold. It retained this shape

FIG. 3.—Tiara of the Pope.

till Boniface VIII. (1294-1808) added to it a second crown, and Urban V. (1862-'70) added a third. It kept to its first sharply pointed form till the beginning of the 16th century, when it assumed an oval shape, swelling out somewhat broad at top.

**TIBALDI**, *Pellegrino*, otherwise called Pellegrino Pellegrini, an Italian artist, born in Bologna in 1527, died in Milan about 1598. At 20 years of age he visited Rome, where he studied the works of Michel Angelo, and was employed by Cardinal Poggio to decorate his palace in Bologna. In 1586 he was invited by Philip II. to Spain, and during a residence there of nine years executed frescoes in the Escorial, besides many pictures. He was also an architect; his best architectural designs were the modern façade attached to the cathedral of Milan, and the Casa Professa, or house of the Jesuits, in Genoa.

**TIBBOOS**. See **TUARIKS**.

**TIBER** (It. *Tevere*; anc. *Tiberis*), a river of Italy, rising in the Tuscan Apennines, 5 m. N. of Pieve San Stefano, and thence flowing generally S. S. E. and S. S. W., through the provinces of Arezzo and Perugia and between the latter and Viterbo, to Fiano, where it turns S. W., and passing through the province and city of Rome discharges into the Mediterranean near Ostia by two mouths, which enclose the Insula Sacra of the ancients. Its length is about 280 m., and its width at Rome and below from 800 to 500 ft. Its principal affluents are the Chiascio, the Nera (anc. *Nar*), and the Teverone (*Anio*) from the left, and the Paglia from the right. In the upper part of its course, between Todi and the Passo del Forello, it is obstructed by rapids and passes for some miles through a narrow gorge. It is navigable for vessels of 180 to 200 tons to Rome, 18 m. from its mouth, and for boats to the confluence of the Nera, about 90 m. Rome and Perugia are the principal cities in its basin. From Perugia, above its confluence with the Chiascio, to its debouchure, its waters have a yellowish tinge, the result of the yellow clay through which it passes. An appropriation was granted at the end of 1875 by the Italian government for the preliminary measures relating to the improvement of the course of the Tiber. Various plans are proposed for that purpose, including one of vast scope advocated by Garibaldi.

**TIBERIAS**. See **GENNESARET**.

**TIBERIUS**, an emperor of Rome, born Nov. 16, 42 B. C., died March 16, A. D. 37. His full name was Tiberius Claudius Nero Cæsar. He was the eldest son of Claudius Tiberius Nero and Livia Drusilla. His father divorced his wife in order that she might be married to Augustus; and when he died, in 33 B. C., his funeral oration was pronounced before the rostra by his son, then only nine years old. Tiberius was educated by the emperor with princely care. In 29 he accompanied Augustus in his triumphal entry into Rome, and

subsequently married Vipsania Agrippina, by whom he had a son named Drusus; but in 11 he was compelled by the policy of Augustus to divorce her, much against his will, and marry the beautiful but dissolute Julia, daughter of the emperor. In spite of her licentiousness he seems to have lived peaceably with her for a year, and had by her one child which did not live; and after that event the feelings of dislike between them gradually increased until they led to a virtual separation. As military tribune Tiberius made his first campaign in the Cantabrian war. In 20 he went to Asia Minor, restored Tigranes to the throne of Armenia, and compelled the Parthians to give up the eagles taken from Crassus; in 15 he and his brother Drusus carried on a war against the Alpine nations of Rætia, and the exploits of the two were celebrated by Horace. In 13 Tiberius became consul with P. Quintilius Varus; in 11 conducted the war against the revolted Dalmatians and the Pannonians; and in 9, when Drusus was fatally injured in Germany, he hastened from Pavia to the place where his brother was dying, and after his death conveyed the body to Rome, walking all the way before it on foot, and on arriving in that city pronounced over it a funeral oration in the forum. He returned to Germany, gained several victories, and crossed the Rhine; but in 7 he went back to Rome, celebrated his second triumph, and was made consul a second time. In 6 he obtained tribunician power for five years, but suddenly formed the resolution of retiring to Rhodes. According to Tacitus, this was to get away from the licentiousness of his wife; but other authorities say it was on account of the jealousy between himself and the grandsons of Augustus. At Rhodes he resided eight years, living in a very simple style. While he was absent his wife was banished (2 B. C.) to the island of Pandataria, and at the expiration of his tribunician power Tiberius asked leave to return to Rome; but permission was not granted till A. D. 2, and then only on condition that he would take no part in public affairs. The death of the two older grandsons of Augustus virtually left Tiberius the succession to the throne, and in A. D. 4 he was adopted by Augustus. From this time to the death of the emperor he was constantly employed in military operations. He conquered all Illyricum, gained great victories over the Germans and the Dalmatians, and in 12 celebrated his fourth triumph. His military successes were all-important, as the loss of Varus and his legions in Germany had placed the empire in danger. In 14 he started for Illyricum to conduct the war in that quarter, when he was recalled by the death of Augustus to ascend the throne. One of the first acts of his reign was to put to death Agrippa Postumus, the only surviving grandson of Augustus, alleging that the execution was in accordance with the wishes of the late emperor. The first years of his

reign were marked by prudence and moderation. He rejected all flattery from the senate, placed in office the most worthy persons, and made efforts to relieve the scarcity of bread constantly recurring in Rome. Meanwhile a mutiny of the legions in Pannonia was only quelled by the energy of Drusus, the emperor's son, and the terror inspired by a solar eclipse. Under the influence of Sejanus, who had become his favorite, the natural severity of his temper began soon to degenerate into cruelty. The election of magistrates was taken from the popular assembly and transferred to the senate, which sat simply to register the decrees of the emperor. The charges of *laesa maiestas*, by which all persons suspected of impugning by word or deed the majesty of the emperor were tried, were prosecuted with great rigor. A secret organization of *delatores*, or spies, was formed, and their infernal machinations exposed the life, the fortune, and the honor of every Roman citizen to hourly danger. After the death of Germanicus (see GERMANICUS) the emperor surrendered himself more and more to the influence of Sejanus. By his advice the prætorian cohorts, stationed hitherto in various parts of the city, were assembled in one camp, in the vicinity of Rome. At the same time the power of the empire was thoroughly maintained in the provinces, and two revolts in 21, one on the Moselle headed by Julius Florus, and the other among the *Ædui* headed by Julius Sacrovir, were put down and their leaders forced to slay themselves to escape from the imperial troops. In 23 Sejanus caused the death of Drusus by poison. Whether Tiberius felt any sorrow or not, he certainly manifested none; and when the people of Troas sent him a message of condolence, he sneeringly sent back an answer of condolence on the death of their fellow citizen Hector. In 26 the emperor finally departed from Rome. He first went to Campania, and there issued an edict commanding the people not to molest his retirement, and in the following year went to the island of Capræ (Capri). The early part of his reign had been marked by a strict regard for external decency, and a stringent law had been passed against courtesans; but his last years were spent in the most infamous pleasures. Capræ became the haunt of disgusting debauchery, especially after the death of Livia Drusilla in 29, who had always exercised much influence over her son. In 30 he banished Agrippina, the widow of Germanicus, and afterward caused the assassination of two of her sons. Henceforth Sejanus had the full control of affairs of state. The employment of *delatores* gave him abundant means of getting rid of obnoxious individuals on false charges. Tiberius, who had been suspecting for some time the plots of his minister, managed to get rid of Sejanus in 31, and the favorite and all his family were destroyed. In the mean time the emperor became, in the words of

Pliny, "the most wretched of men." In the remarkable letter sent to the senate, which Tacitus has preserved, he begins with a frank avowal of his misery. "What to write to you," he says, "or how to write, I know not; and what not to write at this time, may all the gods and goddesses torment me more than I daily feel that I am suffering, if I do know." About this time he went once more to Campania, and occasionally came as near Rome as his gardens on the Vatican. But his privacy was never disturbed; soldiers were placed so as to prevent any one from coming near him. He had been remarkable for beauty and majesty of person, but dissipation had covered his face with ugly blotches, and his body was bent nearly double. At Astura he was attacked by illness, and he reached Misenum to die in the villa of Lucullus. According to Tacitus, it was left to fate to determine his successor. On March 16 he had a fainting fit, and as he was thought dead, Caius Caligula, the son of Germanicus, was saluted as his successor; but the emperor suddenly recovering, a quantity of clothes was thrown over him and he was left alone. There is another account of his death. The people hailed the event with delight, and the cry of "Tiberius to the Tiber" was heard constantly in the streets of Rome. He however had a public burial. The chief authorities for his life are Suetonius, Dion Cassius, and above all Tacitus. He wrote a commentary of his own life, Greek poems, an ode on the death of L. Cæsar, and several epistles and orations, either to the senate or on occasion of funerals. The crucifixion of Christ took place during his reign.—See *Tiberius' Leben, Regierung und Charakter*, by Adolf Stahr (Berlin, 1874).

**TIBET.** See **TIBET.**

**TIBULLUS**, *Albius*, a Roman poet, of the time of Augustus. He was of an equestrian family, and lived on his ancestral estate at Pedum near Rome. He went to Aquitania in 31 B. C. with his patron Messala, and when the latter had pacified that part of Gaul and set out to take command in the East, Tibullus accompanied him, but falling sick returned to Rome, and died young. Four books of elegies are attributed to him, but only the first two are undoubtedly his. Tibullus was a warm friend of Horace, who addressed two poems to him. The first edition of his works was printed, along with Catullus, Propertius, and the *Silva* of Statius, at Venice in 1472. Two of the best late editions are those of Rossbach (Leipzig, 1866) and Müller (Leipzig, 1873). The elegies of Tibullus have been translated into English verse by Dr. Grainger (1752), and a prose translation forms a volume of Bohn's "Classical Library" (London, 1854).—See Seiler, *De Tibulli Elegia* (Halle, 1872).

**TIBUL.** See **TIVOLI.**

**TIO DOULOUREUX.** See **NEURALGIA.**

**TIOHBORNE TRIAL**, the most celebrated conspiracy case, and the first in which the impos-

tor assumed identity with a known person, in English legal records. Roger Charles Tichborne, born Jan. 5, 1829, was, after his father, heir to the title and great estates of his uncle, Sir Edward, who added the name Doughty to Tichborne. After an education in France and at the Roman Catholic college of Stonyhurst, Roger entered the army in 1849. In 1852 he offered himself to his cousin Kate, daughter of Sir Edward; but her parents opposed the marriage, upon which he resigned his commission and went to sea. He arrived at Valparaiso June 19, 1858, and on April 20, 1854, sailed from Rio de Janeiro for New York in the ship *Bella*, which was lost at sea. Sir Edward died March 5, 1858, and was succeeded by his brother James, Roger's father, who died June 11, 1862. In the presumed loss at sea of Roger, he was succeeded by his second son Alfred, who died Feb. 22, 1866, and was succeeded by a posthumous son, born May 28, 1866. In 1865 Lady Tichborne, widow of Sir James, began to advertise in English and Australian newspapers for her son Roger, whom she believed to be alive. In 1866 a butcher in Wagga Wagga, Australia, supposed to be Arthur Orton, but then calling himself Thomas Castro, asserted that he was Roger Charles Tichborne, and had been saved from the wreck of the *Bella*. After some correspondence with Lady Tichborne, he sailed for London, arrived there Dec. 25, and in January, 1867, went to Paris, where Lady Tichborne accepted him as her son and supplied him with money. Nearly every other member of the family repudiated him as an impostor; but he found many adherents who assumed to recognize him as the long lost Roger, and went about England collecting witnesses and gathering information concerning the family, the estates, and incidents in Roger's life. In March, 1867, he filed a bill in chancery to restrain the trustees of the estates from setting up certain outstanding terms as an answer to any action he might bring to recover the property. The commencement of the action was delayed nearly four years by the sending of commissions to South America and Australia, and by other causes. In the mean time Lady Tichborne died, March 12, 1868. The case had excited extraordinary attention. Public opinion was divided, though so many believed in the claimant that he was able to raise considerable money by the sale of bonds payable upon his coming into possession of the property. On May 11, 1871, the trial for the recovery of the Tichborne estates in Hampshire and Dorsetshire, valued at £24,000 a year, was begun in the court of common pleas. With two adjournments, it continued 108 days, till March 6, 1872, when the jury interposed, declaring themselves satisfied that the claimant was not Roger Charles Tichborne, and he was nonsuited. He was immediately ordered into custody to be tried for perjury, but was subsequently released on bail. The trial for perjury of Thomas Castro, otherwise Arthur Or-

ton (as the indictment ran), was commenced in the court of queen's bench on April 23, 1873, and continued 188 days to Feb. 28, 1874, when he was found guilty and was sentenced to 14 years' penal servitude. He was sent to Millbank, and subsequently transferred to Dartmoor prison. The principal points in the two cases which led to the claimant's conviction were these: After assuming to be Tichborne, the claimant, though hard pushed for money, did not avail himself of balances and credits which Roger had with two Australian bankers. On arriving in London he immediately sought for the relatives of Arthur Orton, and subsequently sent to one of the Orton sisters photographs of himself, wife, and child as those of Arthur Orton and family. He was entirely ignorant of incidents connected with Roger's residence in France, and knew no French, which Roger spoke better than he did English. The handwritings of the two were wholly unlike. Roger was well educated, while the claimant was grossly illiterate. The physical differences between the two were even more marked. Roger was thin; his hair was straight; his ears adhered to the sides of his head. The claimant was enormously fat; he was an inch taller than Roger; his head was larger; his hair was inclined to curl; his ears were dependent and free, with large lobes; and it was clearly proved that one of Roger's arms was tattooed with his initials, while no such marks could be found on the claimant. The career of the claimant was also closely traced from the time when he left England to the time when he assumed to be Roger. The expense of the trials compelled the trustees to mortgage the Tichborne estates.—See "Charge of the Lord Chief Justice in the Case of The Queen v. Castro" (2 vols. 8vo, London, 1875).

**TICINO** (Fr. and Ger. *Tessin*), a S. canton of Switzerland bordering on Valais, Uri, Grisons, and Italy; area, 1,095 sq. m.; pop. in 1870, 119,619, nearly all Roman Catholics. The surface is mountainous, but the N. part is more elevated than the S., that frontier being formed by lofty summits of the Alps, including the central mass of the St. Gothard range; and a considerable portion of it belongs to the glacier region. The face of the country has a general slope toward the south, and lofty mountain ridges traverse it in that and a S. E. direction. With the exception of a small part of the north, the drainage belongs to the basin of the Po. The principal river is the Ticino (anc. *Ticinns*), which, rising in Mt. St. Gothard and receiving numerous tributaries, flows through Lago Maggiore, a small portion of which is within the boundary of the canton, to the Po near Pavia. There are several other lakes, including Lugano, Muzzano, and Origlio. In the elevated parts of the canton the chief business is cattle rearing and butter and cheese making. In the south there are on the lower slopes chestnut forests, and in the valleys vineyards, corn fields, and plantations of figs, almonds, oranges, citrons,

mulberries, and pomegranates. Game is abundant in the forests, and the streams and lakes are well stocked with fish. The manufactures are of no importance. The inhabitants belong to the Italian race, and speak that language. Only one village, Bosco, situated near the frontier of Valais, speaks German.—Ticino was conquered from Italy by the Swiss in 1512, and, under the name of the Italian bailiwicks, was governed by deputies till 1815, when it was admitted as a member of the Swiss confederation. The government is vested in a council chosen by all citizens who have attained the age of 20 years. The property qualification of voters was abolished in 1863. The grand council meets alternately at Lugano, Locarno, and Bellinzona. The canton sends six members to the national council. The railway from Bellinzona to Locarno was opened Dec. 20, 1874.

**TICK**, the common name of several families of small arachnids infesting the skin of man and the lower animals. In addition to what has been given under *ERIZOA* and *MITE*, it may be stated that, from the young tick having only three pairs of legs instead of the four pairs of the adult spider and mites, some have maintained that the arachnids form an order of the class of insects, and not an independent class. The legs also in the young are very long and the head separate from the thorax, as in the insect. (See "American Naturalist," vol. iii., 1869, pp. 364–373.)

**TICKELL, Thomas**, an English poet, born at Bridekirk, Cumberland, in 1686, died in Bath, April 23, 1740. He was educated at Queen's college, Oxford, and in 1710 was chosen fellow. He was a friend of Addison. During the negotiations for peace with France, Tickell published a poem entitled "The Prospect of Peace," which went through several editions. On the arrival of King George I. he wrote "The Royal Progress," printed in the "Spectator." His translation of the first book of the Iliad was brought out in opposition to that of Pope. Addison declared it the best version ever made, and it was suspected that he himself was the translator. Besides some minor poems, Tickell published a "Letter to Avignon," written during the dispute on the Hanoverian succession, and an elegy on Addison, which was extravagantly praised by Johnson. Addison had employed Tickell in public affairs, and when in 1717 he was appointed secretary of state, he made him his under secretary. In 1725 Tickell became secretary to the lords justices of Ireland, in which office he died.

**TICKNOR, George**, an American author, born in Boston, Aug. 1, 1791, died there, Jan. 26, 1871. He graduated at Dartmouth college in 1807, studied law, and was admitted to the Boston bar in 1813, but never practised. From 1815 to 1820 he resided in Europe, and on his return became professor of the French and Spanish languages, literature, and belles-lettres in Harvard college. He resigned in 1835, and spent three years in Europe. In 1849 appeared

his "History of Spanish Literature" (3 vols. 8vo, New York; 4th ed., edited by G. S. Hillard, 3 vols., Boston, 1871), which was translated into Spanish, German, and French (in part), and was accepted as an authority in Spain itself. Mr. Ticknor was one of the association of writers by whom the "Monthly Anthology" was conducted. His latest publication was the life of his friend W. H. Prescott (Boston, 1864).—See "Life of George Ticknor," by George S. Hillard (Boston, 1876).

**TICONDEROGA**, a town of Essex co., New York, enclosing the outlet of Lake George, 88 m. N. by E. of Albany; pop. in 1870, 2,590; in 1875, 3,401. It is at the junction of the Addison railroad, a branch of the Central Vermont, with the Champlain division of the Delaware and Hudson canal company's lines, and is the S. terminus of the Lake Champlain company's steamers. The portion of the town lying between Lakes George and Champlain is a lofty promontory, the terminus of a mountain ridge; Mt. Defiance at the extremity of the promontory is 750 ft. above the surface of Lake Champlain. The outlet of Lake George, 4 m. in length, has a fall in 2 m. of 220 ft.; and as the water never apparently varies in quantity, and is remarkably pure, it forms a very valuable water power. There is a vein of excellent graphite in the town, and about 25 tons of black lead are produced monthly by the "American Graphite Company," the only one in the United States. There are also extensive deposits of good iron ore, which is mined by the "Iron Company." Large quantities of lumber are manufactured, and there are an extensive sash and door factory, two foundries, two woollen mills, and a cotton factory of 20,000 spindles. The town has 15 schools, a weekly newspaper, and Baptist, Congregational, Episcopal, Methodist, and Roman Catholic churches. Nearly the entire business portion was destroyed by fire, March 31, 1875; it is now being rebuilt with fine brick blocks.—The town is particularly remarkable for the prominent place its fortifications have held in American history. Early in 1755 the French, who had already occupied and fortified Crown Point, and caused a careful survey of Lake Champlain to be made, advanced to Ticonderoga and commenced a fortification there, which entirely commanded the passage of the lake. This fort they named Carillon (chime of bells), in allusion to the music of the waterfalls near it. It was afterward known as Fort Ticonderoga. Sir William Johnson was the commander of an English and colonial army the same year intended for the reduction of this fortress and Crown Point; but learning that the French had reinforced it largely, he contented himself, after defeating Dieskau at Lake George, with fortifying Fort William Henry at the S. end of that lake. In 1757 Montcalm assembled a force of 9,000 men at Fort Carillon, and ascending Lake George attacked and reduced Fort Wil-

liam Henry, Aug. 8. In the summer of 1758 Gen. Abercrombie took the command of an expedition for the reduction of Fort Carillon, crossed Lake George with 15,000 men, and on July 8 attempted to take the fort by storm, but was repulsed with a loss of 2,000 men. In 1759 Gen. Amherst at the head of 12,000 men invested Ticonderoga, and the French, not having a sufficient force to hold it, dismantled and abandoned it, July 30; and soon after Crown Point was also abandoned. The English government then greatly enlarged and strengthened the two fortresses. The fort and field works of Ticonderoga extended over an area of several miles. After the cession of Canada in 1763, the fort was allowed to fall into partial decay, and was held by a small force. Upon the receipt of the news of the battle of Lexington, Col. Ethan Allen surprised the fort, May 10, 1775, and captured the garrison of 50 men and the artillery and munitions of war in the fort. (See ALLEN, ETHAN.) The centennial of this event was celebrated in the town on May 10, 1875. In 1776, after an engagement between the British and Americans, the latter were compelled to take refuge under the guns of Fort Ticonderoga. On June 30, 1777, Burgoyne invested the fort, and on July 4 erected a battery on Sugarloaf hill (now Mt. Defiance), which completely commanded it and compelled the garrison to evacuate it the next night, sending their stores and munitions to Skenesborough (now Whitehall), and escaping themselves into Vermont. In September of the same year Gen. Lincoln made an attack upon the works, took Mts. Hope and Defiance, released 100 American prisoners, and took 293 of the enemy, an armed sloop, several gun boats, and more than 200 bateaux, but did not capture the fort. After the surrender of Burgoyne the fort was dismantled, and the garrison retreated down Lake Champlain; some of them were captured by Capt. Ebenezer Allen. In 1780 Gen. Haldeman with a company of British soldiers advanced to Ticonderoga and occupied it for some time; and from this point Major Carleton made a diversion against Forts Anne and George, in favor of Sir John Johnson. After the war the fort fell into ruins; portions of the walls are still standing.—There is a history of Ticonderoga by the Rev. Joseph Cook (Keeseville, N. Y., 1858).

**TIDES**, the alternate rising and falling of the waters of the ocean, which is to be observed on all its coasts and estuaries. The rising is designated as the flood, and the highest elevation as high water; the falling is called the ebb, and the lowest depression low water. The duration of high and low water without apparent change of level is known as the stand, and the cessation of the ebb and flood streams or tidal currents is called slack water. The tides of each day occur somewhat later than those of the preceding day, the average retardation from day to day being about 50

minutes. The times of occurrence of high water bear a very close relation to the appearance of the moon in certain positions. Thus at New York high water occurs when the moon is about E. S. E.; at New Castle, on Delaware river, when the moon is nearly S.; at Baltimore when it is rising or setting. These are rude statements, but they are sufficiently accurate for many purposes, and they show at once the close connection between the time of high water and the time of the moon's passage over the meridian. In fact, so completely is this recognized, that, in order to give the time of high water upon any day, it is usually thought sufficient to state the time of high water on the days of new moon and full moon (or "full and change") when the moon passes the meridian at 12 o'clock nearly. This time is called the establishment of the port. Then to find (roughly) the time of high water on any other day, it is only necessary to add the establishment to the time of the moon's meridian passage on that day. There will also be another high water on the same day, preceding or following that so found by 12h. 26m. nearly. On closer examination it will be found that the interval between the time of the moon's passage over the meridian and the time of high water varies sensibly with the moon's age. At new moon, full moon, first quarter, and third quarter (or rather on the day following each of these phases), the interval between the time of the moon's passage and the time of high water is nearly the same; but from new moon to first quarter, and from full moon to third quarter, the high water occurs earlier than would be inferred by using that same interval; and from first quarter to full moon, and from third quarter to new moon, it occurs later than the same interval would give it. The height at high water and the depression at low water are not always the same. On the days following new moon and full moon, high water is higher and low water lower than at any other time; these are called spring tides. On the days following the first and third quarters, high water is lower and low water higher than at any other time; these are called neap tides. Thus at New York the rise and fall (that is, the difference in elevation between high water and low water) is about 5½ ft. at spring tides, and 3½ ft. at neap tides. At Boston this variation is from 11½ to 8½ ft. There is a sensible difference in height between two successive high waters or low waters, one occurring before noon, the other after noon, and these differences are most perceptible when the moon is at her greatest declination N. or S., and disappear when she is near the equator. There are other variations of height depending on other circumstances. In a single tide the interval from high water to low water is greater than that from low water to high water; the difference between these intervals is sensibly greater at spring tides than at neap tides. The tidal current in

the bay runs upward for some time after high water, and after changing its direction continues to run downward for some time after low water, when it again changes its direction, and runs upward. If we further examine the state of the tide in different parts of the same river, or in a bay of great length as compared with its breadth, as for instance Chesapeake bay, we shall find that near the mouth there is very little difference between the interval from high to low water and that from low to high water; also that the current runs up the channel for a long time (sometimes approaching to three hours) after high water, and runs down the channel for as long a time after low water. In going up the bay we find that the high water occurs later and later, but the velocity with which the high water travels is so great as entirely to preclude the idea of explaining the tide by supposing the same mass of water to have been moved all the way up the bay. Thus, high water is 13 hours in travelling from Cape Henry to the head of Chesapeake bay, 190 m., moving with an average velocity of 15 m. an hour, while the greatest observed current is less than one mile an hour. High water takes place simultaneously near the head and the mouth of the bay, while it is low water at the same time near the middle. The interval from low water to high water diminishes as we go up the bay, as also the difference between the stand and slack water. At the entrance of the bay the ebb current begins three hours after the high water stand; in the vicinity of Annapolis it is but one hour, and at the head of the bay there is only half an hour between the high water stand and the commencement of the ebb current.—Herodotus speaks of the tides in the Red sea. Plutarch says that Pytheas of Massilia, who had observed them in Britain, ascribed them to the moon. Caesar, in his account of the invasion of Britain, refers to the nature of spring tides as well understood in connection with the moon's age. Pliny explains the phenomena at some length, and ascribes them to the sun and moon dragging the waters along with them. Kepler in accounting for the tides was evidently aware of the principle of gravitation, but not of the law. Newton laid hold of this class of phenomena as the most incontestable proof of universal gravitation, and showed that according to its law just such periodic fluctuations in the fluid covering of the earth must take place as are actually exhibited by the tides of the ocean. If we conceive the earth to be wholly or in a great degree covered with water, and subject to the attraction of the sun, the force of which is inversely as the square of the distance, it will be obvious that while the whole earth will fall toward the sun with a velocity proportioned to the aggregate attraction upon its solid portions (which is the same as if all the matter were collected at its centre), the water nearest to the sun, being accelerated

by a greater force, and being fluid, will approach the sun more rapidly than the solid core. It will thus run from all sides into a protuberance beyond the form of equilibrium of the earth's attraction and rotation, until the pressure of the elevated mass equals the difference in the attraction of the sun. Moreover, a similar protuberance will be formed on the side opposite to the sun, since the particles of water, being solicited by a less force than the solid core, will fall more slowly toward the sun, and as it were remain behind. Nor does the fact that, on the average, the earth does not lessen its distance from the sun, in the least invalidate the force of this reasoning; for the deviations from the tangential motion of the earth in its orbit are precisely those which the earth would move through if falling toward the sun unaffected by any other impulse. The same considerations hold good in regard to the attraction of the moon upon the earth and the waters surrounding it; for although we are in the habit of considering the moon as simply revolving about the earth, it must be remembered that the attraction is mutual, that both bodies describe orbits about their common centre of gravity, and that while the moon obeys the attractive force of the earth, the latter equally follows that of the former, by which it is at every instant of time drawn from the path which it would pursue if that influence did not exist, by an amount precisely equal to the fall corresponding to the moon's attractive force. As a necessary consequence of the elevation of the water in the regions nearest to and most remote from the attracting body, there must be a corresponding depression below the mean level of the sea at points distant  $90^\circ$  from the vertices of the protuberances, or at the sides of the earth as seen from the sun or moon. If the latter bodies maintained a constant position with respect to the earth, the effect would therefore be to produce a distortion of figure in the ocean surface (assumed to cover the whole earth) having the form of a slightly elongated ellipsoid, the two vertices of which would be, the one precisely under, the other precisely opposite to the points at which the disturbing body is vertical. But this is not the case; for by the rotation of the earth and the motion of earth and moon in their orbits, the direction of the disturbing forces is constantly changing with respect to any point on the earth's surface. New points arrive at every instant under the zenith and nadir of either luminary, and thus waves are produced which follow them round the globe. The highest points of these waves will remain far behind the verticals of the disturbing bodies, because the inertia and friction of the water prevent the instantaneous change of form required, and because, although the elevating force is greatest under the vertical, it continues to act in the same direction for some hours after the passage of the luminary, with but little diminished force. This retardation, which would be

sensible under the simple supposition of an uninterrupted ocean covering the earth's surface, becomes very considerable under the actual circumstances of the case.—The depth of the sea varies so much, and the form of its basin, taken as a whole, is so interrupted by the land, that it may be doubted whether, were the action of the sun and moon at once suspended, their tide waves would perform even a single revolution with any sort of regularity. Hence it follows that the tides for the time being may be considered as almost completely commanded by the then actual positions and proximities of the sun and moon, the free oscillations of the sea in its bed being quite subordinate to the forced wave generating them. In consequence (as is always the case in forced oscillations), every periodicity in the action of the forcing cause is propagated in the oscillations, and records itself in the recorded height of the tide on every point of the coast, but at each point at a greater or less interval from the culmination of the sun or moon, according to its local position and the more or less circuitous course taken by the tide wave to reach it, which special observation can alone determine. This interval is called the establishment of the place. The close relation which the times of high water bear to the times of the moon's passage shows that the moon's influence in raising the tides must be much greater than the sun's. In fact, while the whole attraction of the sun upon the earth far exceeds that of the moon, yet, owing to the greater proximity of the latter, the difference between its attraction at the centre of the earth and at the nearest or most remote points of its surface, which produces the tides, is about  $2\frac{1}{2}$  times as great as the difference of the sun's attraction at the same points.—There will be two complete lunar tides in every lunar day of 24h. 52m., and also two complete solar tides in every mean solar day. These are known as the semi-diurnal tides, and constitute the principal fluctuations of the sea level. When the sun and moon are in conjunction or opposition, at the time of new or full moon, the effects of both combine to produce the spring tides, when high water is higher and low water is lower than at mean tides by the amount of the solar tide. At quadratures the high water of the sun will combine with the low water of the moon to produce a less fall, and the low water of the sun with the high water of the moon to produce a less rise, than at mean tides; and we have the neap tides, the range of which is less than the mean range by the amount of the solar tide. Thus, at New York, the rise and fall at syzygies is 5.4 ft., at quadrature 8.4 ft., the former being the sum, the latter the difference of the lunar and solar tides; whence we obtain for the effect of the moon 4.4 ft., and for that of the sun 1 ft., or a ratio of 4.4 to 10. This proportion does not prove to be the same in all parts of the world, and even varies considerably in places not far distant from each

other. At Boston the heights are 11.3 and 8.5 ft. respectively, giving a proportion of 7 to 1. On the Atlantic coast of the United States it averages about 5 to 1, while on the E. side of the Atlantic ocean, on the coasts of France and England, it is in many parts 3 to 1. These differences are to be ascribed to the fact that the shore and harbor tides which we observe have in every instance acquired a greater magnitude than the ocean tides, and have been modified in form by the varying slope of the bottom and configuration of the shores. A simple comparison of the range of spring and neap tides will not serve, therefore, as a correct measure of the relative effect of the sun and moon, and hence for a determination of the mass of the moon, which can only be derived from those data by a profound mathematical analysis.—The next variation of the tides to be considered is that dependent on the moon's declination. Were the moon constantly in the plane of the equator, the highest points of the tide waves would also be in that plane, and would consequently produce a series of equal tides at any place either N. or S. of the equator. But it is evident that when she ascends to the north, the vertex of the tide wave will tend to follow her, giving the highest point of one tide in the northern, and the highest point of the opposite tide in the southern hemisphere. Consequently, when the moon has a northern declination, the tide at any place in the northern hemisphere caused by her upper transit will be higher than that caused by the lower transit. This variation in the heights has a period of one lunar day, and is called the diurnal inequality; it reaches its maximum when the moon is at its greatest northern or southern declination, and disappears when it is on the equator, and consequently has a half-monthly period. The variations of height from this cause produce a corresponding inequality in the times of high water. The sun's declination affects the tides in a similar manner, but the amount of the disturbance is very small, and its period extends over half a year. Yet in long series of observations its effect is well marked, both in height and time. The diurnal inequality depending on the moon's declination is on the other hand quite sensible, and in many places constitutes a prominent or even the chief feature of the tides, as on the Pacific coast of North America and in the gulf of Mexico, to the peculiarities of which we shall recur hereafter. If the tides arrive at the same place by two different channels, and one of them is retarded behind the other by six hours, in consequence of travelling a longer route or in shallower water, the semi-diurnal tides will be destroyed by an interference of the waves, that is, by the high water of one being superimposed on the low water of the other; the diurnal inequality, however, will not be destroyed, but merely modified in height and time, leaving a single tide in the lunar day

outstanding, which is always very small in amount. A further cause of variation in the height of the tides is the variation of the distances of the sun and moon, by reason of the ellipticity of their orbits. The efficacy of a heavenly body in raising tides is shown by theory to be inversely proportional to the cube of the distance. Hence the efficacy of the sun will fluctuate between the extremes 19 and 21, taking 20 for its mean value, and that of the moon between 48 and 59. Taking into account this cause of difference, the highest spring tide will be to the lowest neap as  $59 + 21$  to  $48 - 19$ , or as 80 to 24, or 10 to 8; leaving out of consideration the local circumstances of access and depth, which greatly modify these proportions. In the North Atlantic the highest tides are observed a day and a half or two days after the syzygies. At New York, the high water which we observe about 8 o'clock in the evening on the days of full or change are those due to the meridian transit of the moon (and sun) on the preceding day, and the highest tide will not occur until the evening of the following day. At Boston this delay, which is called the retard, or age of the tide, is nearly 36 hours. It is the same at Brest, and the tide wave occupies 10 hours in travelling from Brest up the English channel and Thames to London, making the age of the tide at the latter place 46 hours. This delay, which even at the cape of Good Hope amounts to 14 hours, is still the subject of investigation, and is probably mainly due to friction. The interval between the moon's passage over the meridian of a place and the time of high water, which we have referred to as the establishment of the port, is also called the luni-tidal interval. This interval is constant for each place so far as the lunar tide wave is concerned; but as the actual high water depends upon the combination of the lunar and solar tides, it is subject to a variation which is known as the half-monthly inequality in time. On the day after the spring tides the top of the solar tide wave will be nearly an hour in advance of that of the lunar tide wave, and the two waves will combine to make high water earlier than the moon's alone would bring it; hence the luni-tidal interval is shorter. It will continue to shorten until the moon's transit is later by three hours than when the tide is greatest; it then increases again, passes its mean value when the moon has fallen behind six hours, attains its maximum when it is nine hours later, and again decreases until at the next spring tides it reaches its mean value. The mean of all the luni-tidal intervals for half a month at a port is called its mean or corrected establishment, to distinguish it from the vulgar establishment, which is the luni-tidal interval at full and change. The former is now generally used for finding the time of high water on any given day, and tables are constructed from observations at the principal ports for finding the correction

for semi-monthly inequality due to the moon's age. Thus for New York the corrected establishment or mean luni-tidal interval is 8h. 18m., and its least and greatest values are 7h. 52m. and 8h. 35m. On the Atlantic coast of the United States the range of this inequality is about three fourths of an hour; on the coasts of France and Great Britain it often exceeds an hour and a half. This difference of the half-monthly inequality in time at different places is analogous to the variation in the proportion of spring and neap tides above noticed, and is due to the same causes.—The motion of the water in the tide wave is totally unlike that in an ordinary surface wave, such as the wind produces. When a narrow wave of the latter kind, or a succession of such waves of equal breadths and heights, is formed in deep water, a light floating body, as a cork, revolves either in a vertical circle or an ellipse not very different from one, having the longer axis vertical. But in the tide wave the movement of each particle may be regarded as performed in an excessively elongated ellipse, the shorter axis of which is vertical. The breadth of the tide wave from crest to crest, supposing all the earth covered, would be half the earth's circumference, or 12,500 miles, in comparison with which the depth of the sea is insignificant; and the slightest consideration suffices to show that, as all the water which goes to form the elevated portion must be brought from that depressed, this can only take place by a lateral approach of the vertical sections of the sea when the water is rising, and their recess from each other when falling (*i. e.*, over a quadrant of the globe in either case, which is only another way of expressing an alternating backward and forward horizontal current at any given place), with this peculiarity, that these currents (the flow and ebb current) run most rapidly at the moments of high and low water; the instants of most rapid rise and fall being those of slack water or no current one way or the other. In fact, it is obvious that the surface must be rising most rapidly when the water is setting in equally both ways to, and sinking most rapidly when setting out equally both ways from the place; in neither of which cases can there be any current at the place. The tide wave differs also from a wind wave in another very remarkable point. It affects the whole depth of the ocean equally, from the bottom to the surface, while the wind waves, even in the most violent storms, agitate it to a very trifling depth; for the force which acts to produce the former is exerted equally in every portion of the vertical extent of the water, while those producing the latter are strictly confined to the surface. A tide wave of 4 ft. in total height (between high and low water), which is that of the tide at the atolls of the Indian ocean, advancing over a sea 30,000 ft. deep, implies in each particle an alternate advance and recess of 2,800 ft. in its total extent; but this movement, being

spread over six hours either way, is nowhere very rapid. Where a bay or indentation of the coast presents its opening favorably to the tide wave, and decreases in width from the entrance toward its head, the tides rise higher and higher from the mouth upward. This is due to the concentration of the wave by the approach of the shores, and to the gradual shoaling of the bottom by which a portion of the horizontal motion is transferred into vertical motion, the velocity of the wave being at the same time retarded. This effect is strikingly illustrated by a generalization of the heights of the tides on the Atlantic coast of the United States, developed from the tidal observations made in connection with the United States coast survey. That coast presents in its general outline three large bays: the great southern, from Cape Florida to Cape Hatteras; the great middle, from Cape Hatteras to Siasconset, Nantucket; and the great eastern, from Siasconset to Cape Sable. Referring to the tide table given below, we find at Cape Florida a mean height of 1.5 ft., and as we follow the coast to the northward a gradually increasing height, reaching 7 ft. at Savannah entrance, then decreasing again, with an exception easily explained, to Cape Hatteras, where it is 2 ft. In the middle bay, following the stations on the coast, and omitting those on the bays and sounds, we have a less regular increase to 4.8 ft. at Sandy Hook, and a decrease to 2.7 ft. at Menemsha light on Nantucket island. The configuration of the eastern bay is less regular, and the correspondence of heights requires closer examination. The recess of Massachusetts bay is well marked by the increase in height, reaching 10 ft. at Boston and Plymouth; but the most striking effect of the convergence of shores and shoaling is exhibited in the bay of Fundy. On a line across its mouth, at the Kennebec river as at Cape Sable, the mean height of tide is 8 ft., while at St. John's, N. B., it rises 19 ft., and at Sackville in Cumberland basin, at the head of the bay, 36 ft., attaining to 50 ft. and more at spring tides. When the wave leaves the open sea, its front slope and its rear slope are equal in length and similar in form. But as it advances into a narrow channel, bay, or river, its front slope becomes short and steep, and its rear slope becomes long and gentle. Hence arise the circumstances noticed in the early part of this article, and illustrated by reference to the Chesapeake bay. At the station near the sea the time occupied by the rise is equal to that occupied by the descent; but at a station more removed from the sea the rise occupies a shorter time than the descent. When the tide is very large compared with the depth of water, this inequality becomes very great; thus in the Severn river, at Newnham, above Bristol (England), the whole rise of 18 ft. takes place in an hour and a half, while the fall occupies 10 hours. As the wave advances over a shoaling bottom, a portion of the horizontal motion

is transformed into vertical motion, by which the height of the wave is increased, the most rapid current approaches the greatest rise, and the interval between the stand and slack water is diminished. This exaggeration of the height and current is particularly remarkable whenever the front of the advancing tide wave stretches across the mouth of an estuary with contracting borders, and extensive flats bordering the channel near low-water level; then it produces a bore, or sudden and violent wave of great height, which rushes forward with such impetuosity as to sweep everything before it. Such is the case at the head of the bay of Fundy; likewise in the Hoogly river, in the bay of Bengal; in the Dordogne, where it empties into the Garonne, on the coast of France; and in the Severn river, where at spring tides a bore of 9 ft. in height rushes up stream. In the river Amazon, at the equinoxes (when the equatorial tide is at its maximum), during three consecutive days bores of 12 or 15 ft. high rush up the river with each high water; so that along the course of the stream, up which for 200 m. from its mouth no fewer than eight tide waves are simultaneously advancing, as many as five bores are sometimes at once in progress.—It is easily seen that in the smaller seas, which have little or no communication with the ocean, as the Mediterranean, Black, and Caspian seas, and the North American lakes, the tides must be insensible, as the attraction of the moon is at all times very nearly the same for all parts of them. Near the W. end of the Mediterranean, as at Malaga, a small tide is observable, propagated from the Atlantic ocean through the straits of Gibraltar. Tides are also observable at Venice, but the observations have not been discussed so as to determine whether they arise from a small tide wave proper to the Mediterranean, magnified by travelling up the Adriatic sea, although insensible at its mouth, or whether they are variations due to the winds. Fluctuations of the sea level resembling those of the tides, and causing irregularities in the latter, are often produced by the winds, which in many places have a certain periodicity in their direction and force, as the land and sea breezes in the tropics. They come under consideration here only as complicating the study of the tidal phenomena.—The existing theories, while they suffice for the explanation of the observed facts, are inadequate to the prediction of the phenomena at places where they have not been observed. This arises not from any defect in the principles upon which the theory is based, but from the difficulty of investigating mathematically the motion of fluids, under all the various circumstances in which the waters of the sea and of rivers are found, and from our ignorance of the configuration of the bottom of the sea. The equatorial sea being broken up into three great basins, and open water existing only to the southward of the three great continents, the tides are complicated in

a singular way. In each of these basins the equatorial tide has to take a fresh start from the eastern side with every fresh upper and lower transit of the moon and sun, and is destroyed or confused by reflection on the western coast before the creation of a new wave; while in the open part of the southern ocean the tide wave circulates unimpeded, and spreads into the three oceans up which it runs as a free wave, from S. E. to N. W., overtaking in its progress and compounding with the partial equatorial tides or forced waves proper to either ocean. On approaching the shore, the waves are elevated and retarded by the slope of the bottom, and deflected or crowded together according to the varied configurations of the coasts. It is owing to these complications, together with our ignorance of the laws of friction among the particles of water, and between the water and the bottom, that our theories fail to inform us of the magnitude and time of the tides at any given place. But they determine the periodicity of their phases, and the relative part which each disturbing force bears to the whole, by which we are enabled, by the analysis of a sufficient series of exact observations at any place, to predict the phases of the tides at the same place for any future time, the knowledge of which is of immense importance to navigation. It is only since the beginning of the present century that the science of the tides has made any considerable progress in this direction. The theoretical investigations of Laplace, in the *Mécanique céleste*, and his discussions of the tidal observations at Brest, opened the way. Lubbock and Prof. Whewell contributed largely by the elaborate discussions of large collections of tidal observations, published in the "Philosophical Transactions" of the royal society; and Prof. Airy, in his essay on "Tides and Waves" in the "Encyclopædia Metropolitana," has greatly extended our theoretical conceptions of the subject. More recently still important investigations have been published by Prof. W. Thomson and Mr. W. Ferrel.—The tides on the coasts of the United States have been specially investigated by the late Prof. Bache as superintendent of the American coast survey. In connection with that work he organized an extensive system of exact observations, for the purpose of ascertaining the complicated laws which govern the tides. It will be readily understood that in order to separate the effects of the different causes which modify the phenomena, it is not sufficient to observe merely the heights and times of high and low water, but that a continuous record of the tides is necessary, as the inequalities are constantly shifting their place and magnitude. For this purpose a self-registering tide gauge is used, by which a continuous curve representing the successive changes in the height of water is traced on paper moved by clockwork, by a pencil acted on by the rising and falling of a float in a vertical box, to which the tide has free access.

The time scale is such that every hour is represented by one inch, and is pricked into the paper by points on the cylinder which moves the paper forward. A continuous sheet, sufficient for the record of a whole month, is put on the tide gauge at one time. A complete description of this instrument will be found in the coast survey report for 1858. Prof. Bache gave in his annual reports on the progress of the coast survey, from 1851 forward, a series of papers on the tides, detailing the processes of discussion, and giving the results as they were from time to time developed. In these are considered the apparent anomalies in the tides in the gulf of Mexico, exhibiting at some places only one tide in 24 hours; the large inequalities in the tides on the Pacific coast; the general progress of the tide wave along our coasts and in the bays and rivers; the influence of the winds in particular localities; and the action of tidal currents on the bars and channels of our harbors. These labors, which are still in progress, have resulted already in the annual publication of "Tide Tables," giving in advance the times and heights of high and low water at all the principal ports of the United States, for every day in the year. An elaborate discussion of the tides observed at Boston and New York during 19 years, a full lunar cycle, has been made by Mr. William Ferrel of the coast survey, and has resulted in representing the actual tides with unlooked-for precision, yielding moreover a value for the mass of the moon closely approaching that obtained by astronomical methods.—The tides on the coast of the United States, on the Atlantic, gulf of Mexico, and Pacific, are of three different classes. Those of the Atlantic are of the most ordinary type, ebbing and flowing twice in 24 hours, and having but small differences in height between the two successive high or low waters, one occurring before noon, the other after noon. Those of the Pacific coast also ebb and flow twice during 24 hours, but the morning and afternoon tides differ very considerably in height, so much so that at certain periods a rock which has 8½ ft. of water upon it at low tide may be awash (nearly bare) on the next succeeding low water. The intervals, too, between successive high and successive low waters may be very unequal. At San Francisco, for example, at a time when the moon has a large southern declination, the high water occurring about 13 hours after the moon's transit may mark 5 ft. on a tide staff; five hours afterward low water will mark 8½ ft., six hours after which the second high water will reach 7½ ft., and seven hours later the second low water will fall to zero. These inequalities depend upon the moon's declination, in the manner which we have explained; they disappear at the time of the moon's declination being nothing, and are greatest about the time of its being greatest. These tides exhibit the normal type, while those at New York and adjacent parts of the Atlantic coast do not exhibit the diurnal in-

equality. The explanation of this feature is probably to be found in the supposition that the tide wave which advances up into the Atlantic ocean from the continuous tide in the Southern ocean, arrives on our shores 24 hours later than the direct tide wave which crosses the Atlantic from E. to W. In this way the diurnal inequality will be eliminated by the superposition of the two tides, the greater high water of the former coinciding with the lesser of the latter, and *vice versa*, leaving the semi-diurnal tides of equal height. The tide at Galveston, in the gulf of Mexico, furnishes a case of the elimination of the semi-diurnal tide, leaving only the diurnal inequality. It is to be presumed in this instance that the tides reaching Galveston through the straits of Florida and through the passage between Cuba and Yucatan differ by six hours in their periods, causing the low water of one to coincide with the high water of the other, thus sensibly destroying the semi-diurnal tides, except in so far as they are unequal. This leaves a small tide outstanding, having substantially the form of the diurnal inequality, and producing the appearance of the "single day tide," or one high and one low water in every 24 hours. This residual fluctuation is well marked at times when the moon's declination is considerable on either side of the equator, but disappears almost entirely when the moon is near the equator, since at such times the diurnal inequality disappears. Tides of this class have always a small range; in the gulf of Mexico they rarely exceed  $2\frac{1}{2}$  ft., and the average rise and fall is but  $1\frac{1}{2}$  ft. The tide gauges being in continuous operation, all other fluctuations of the ocean level, besides that produced by the tides, are likewise registered. The tide curves of the western coast are frequently found indented by fluctuations arising from earthquakes. A remarkable instance of this kind was furnished by the earthquake that destroyed the city of Shimoda, Japan, in December, 1854. The time required for the transmission of the sea waves from Shimoda to San Francisco was 12h. 36m. The distance being 4,500 m., the transmission of the wave was at an average rate of 360 m. an hour. The theory of wave motion teaches us that this velocity will be attained by a free-moving wave in a depth of 1,440 fathoms, which may be taken as the average depth of the Pacific between Japan and California. The crests of the waves occurred at intervals of about 23 minutes, corresponding to a length from crest to crest of 150 m. The height when the waves arrived at San Francisco was about 18 in. from hollow to crest. The great earthquake in Peru in August, 1868, was likewise recorded on the tide gauges at San Diego, San Francisco, and Astoria. The fluctuation of the ocean in this instance was very sensible to casual observation, and was noted in Australia, at the Sandwich islands, and at Kodiak, Alaska. The data obtained from these observations, combined with the result before mentioned, indi-

cate that the average depth of the Pacific ocean is about 1,800 fathoms. Such waves, originating with an impulse at one definite point, and propagated freely through the ocean in every direction with a velocity depending upon the square root of the depth of the sea, serve as good illustrations of the manner in which tides are propagated as free waves through sounds, bays, and rivers. The rate of motion for different depths is as follows: at 10 ft., 12.2 m. an hour; 60 ft., 80 m.; 100 ft., 88.7 m.; 1,000 ft., 122.3 m.; 6,000 ft., 299.5 m.

TIDE TABLE FOR THE UNITED STATES.\*

PORTS.	Mean lun- tidal interval.	Rise and fall, spring tides.	Rise and fall, neap tides.

A study of the preceding tables, with the aid of a map, will develop many interesting facts with regard to the propagation of the tide wave and the effect of the configuration of the coasts on the time and height of the tides. It will be seen, for example, that high water occurs nearly at the same time at the headlands of the great middle and eastern bays of

the Atlantic coast of the United States—at Cape Hatteras, Nantucket island, and Cape Sable—making an allowance for the difference in local time. If by a line on the map we connect these points at which high water occurs simultaneously, we may regard that line as representing the crest of a tide wave advancing upon the coast. We shall find high water to occur later and later as we go up into the bays and rivers; and by following up the progress of the waves, we may be enabled to draw lines representing the time of high water or the top of the wave for each successive hour. Such lines are called co-tidal lines, and have been traced for the coasts of the United States by Prof. Bache, for which we again refer to the coast survey reports. A chart of co-tidal lines for the British isles, by Prof. Whewell, will be found in Keith Johnston's "Physical Atlas," as well as a chart of co-tidal lines for the whole globe; but the latter must be looked upon as a rather adventurous generalization, in the absence of any positive knowledge of the tides in mid-ocean. The tides about the British isles present a very interesting study. The advancing high water passes up the English channel, occupying six hours from the Scilly isles to the mouth of the Thames, where it is met and reinforced by the high water 12 hours older, which has travelled around the isles to the northward and down the North sea. There is a point in the latter, about midway between Yarmouth and the Texel, where the co-tidal line of nine hours of the latter tide wave intersects that of three hours of the former, causing the interference of low water of the one with high water of the other tide, in consequence of which no change takes place in the sea level, as has been ascertained by actual observations over a shoal spot in that locality. A remarkable case of the meeting of two tides, which will be more particularly noticed below, occurs near Throg's Neck at the W. end of Long Island sound.—The agency of tidal currents in producing changes in the entrances of bays and harbors is a subject of the first importance to commerce and navigation, which has received full attention in the prosecution of the American coast survey. As on the average the same amount of water moves inward and outward with the flood and ebb tides, we might readily suppose that the same amount of material is transported either way, and that no important change would take place in the configuration of the bottom. But the operation of the flood stream is very different from that of the ebb stream. We have as a general feature an interior basin of some extent communicating with the sea by a comparatively narrow passage. The flood stream, therefore, running with considerable velocity through this channel, will as it enters the basin spread out and become slow, depositing the sand and mud it is charged with, and making extensive flats or shoals opposite the entrance. The ebb stream runs slowly over the flats from

all directions toward the opening, without removing much of the deposit, and gradually concentrates in definite narrow channels, which it scoops out, and the depth of which will depend in a great degree on the proportion of the area of the basin to the outlet, or, in other terms, on the difference of level which will be reached during the ebb between the basin and the ocean, which determines the greatest velocity and transporting power reached by the ebb stream. On the bars of most of the sand-barred harbors on our southern coast, the place and direction of the channel are frequently changed during violent storms, when the direction of the waves happens to be oblique to that of the channel; or when the sea runs directly upon the channel, the depth of water may be considerably diminished for the time being, by the sand rolled up by the waves. But in all these cases it is found that the normal depth is speedily restored by the scour of the ebb tide, which depends upon the unchanged factors of area and form of basin, height of tide, and character of the material forming the bar. To illustrate the important subject of tidal currents, we will examine the hydraulic system of New York harbor. Considering first the progress of the tide wave through Long Island sound from the eastward to its meeting with that entering New York bay at Sandy Hook, we see that about  $7\frac{1}{4}$  hours after the transit of the moon high water has advanced just within Block island with an elevation of 2 ft., and at the same time has just passed Sandy Hook with an elevation of  $4\frac{1}{4}$  ft. Traversing the sound westward with increasing heights, it reaches Sand's Point three hours later with a height of 7.7 ft. The observed time of transmission from the Race to Sand's Point is 2h. 1m., and the time computed from the depths according to the law developed by Airy is 2h. 14m.; a very good approximation when we consider the irregularities in the configuration of the sound, which could not be taken into account. Advancing still further, the height somewhat declines in consequence of the changes of direction in the channel and its shallowness. At Hell Gate this tide wave is met by that which had entered at Sandy Hook, and advanced more slowly owing to the narrowness and intricacies of the channel, especially in the East river. These two tides which meet and overlap each other at Hell Gate, differing in times and heights, cause contrasts of water elevations between the sound and harbor which call into existence the violent currents that traverse the East river. The conditions of the tidal circulation through Hell Gate are such that if there were a partition across it, the water would sometimes stand nearly 5 ft. higher, and at other times 5 ft. lower on the one side than on the other. In the actual case of the superposition or compounding of the two tides, the difference of level existing at any time is of course much less, but the difference of one foot is often

observed within the space of 100 ft. in the most contracted portion of Hell Gate off Hallett's Point. The entrance from Long Island sound is a natural depression or arm of the sea which is not changed by the forces now in operation. The tidal currents which flow through it do not change the channel, but are obliged to follow it in its tortuous course. The Sandy Hook entrance, on the contrary, is characterized by a cordon of sands extending from Sandy Hook to Coney island, intersected by channels, which are maintained against the action of the sea, which tends to fill them up, by the scour of the ebb tide from the tidal basin of New York harbor. The advance of Sandy Hook upon the main ship channel is among the notable and important instances of the effect of tidal currents; within a century it has increased a mile and a quarter. In the place where the beacon on the end of the Hook now stands there was 40 ft. of water 15 years before it was built. The cause of this growth is a remarkable northwardly current along both shores of the Hook, running both during the flood and the ebb tides with varying rates, and resulting from those tides directly and indirectly. The best water over the bar is about 2 m. E. of Sandy Hook light, in a direct line with the Swash channel; the greatest depth over it is 22 ft. at mean low water, and the same depth can now be carried through the Swash channel, which formerly was 3 ft. shallower, but has deepened since the cross section between the Hook and Flynn's knoll has been diminished by one third its area by the growth of the Hook. This relative change in the capacity of the channels has not affected the depth on the outer bar, which, according to the principles above laid down, is dependent mainly upon the area of the tidal basin within. The depth of 22 ft. at mean low water, which is now maintained at the entrance, through the sands constantly thrown up by the waves of the sea, may be considered as depending upon the following elements: 1, the large basin between Sandy Hook and Staten island, including Raritan bay, which furnishes more than one half of the whole ebb scour; 2, what is called the Upper bay, including the Jersey flats and Newark bay; 3, the North river, perhaps as far as Dobbs Ferry, maintaining the head of the ebb current, although not directly taking part in the outflow; and 4, a portion of the sound tide, which flows in through Hell Gate. The proportion of the first three divisions in producing the depth of channel may be approximately estimated by a comparison of the areas and distances from the bar. In order to maintain the depth which we now have, it is important that the area of the tidal basin should not be encroached upon. In proportion as that is diminished the depth of the channels will decrease. The flats, just bare at low water, but covered at high tide, form as important a part as any other portion, for it is obvious that it is only the volume of water con-

tained between the planes of low and high water, the "tide prism," that does the work in scouring the channels. The water on the flats is especially useful by retarding the outflow, thus allowing a greater difference of level to be reached between the basin and the ocean. The part which the fourth division in our classification of the basin of New York, that of the East river and Hell Gate passage, plays in the outflow of the ebb tide through the Sandy Hook channels, depends less upon the area involved than upon the difference in point of time and height of tide in Hell Gate already adverted to. The westerly current, usually called the ebb stream since it falls in with the ebb stream of New York harbor, taking place when the sound tide is highest, starts from a level  $8\frac{1}{2}$  ft. higher than the easterly, and thus a much larger amount of water flows out through the Sandy Hook channels than through the narrows at Throg's Neck. It is apparent, then, that this portion of the ebb stream, reinforcing the ebb stream of the harbor proper at the most favorable times, performs a most important part in maintaining the channels through the Sandy Hook bar.

**TIECK.** I. Ludwig, a German author, born in Berlin, May 31, 1778, died there, April 28, 1858. He completed his studies at Halle, and became known in 1795 as a writer of fantastic novels. His antagonism to the literary tendencies of the time was displayed in *Peter Lebrecht* (2 vols., 1795-'6), and in *Peter Lebrecht's Volkemärehen* (8 vols., 1797), several of which, as *Der gestiefelte Kater* ("Puss in Boots"), *Blaubart* ("Bluebeard"), and *Leben und Tod des kleinen Rothkäppchen* ("Life and Death of Little Red Riding Hood"), combine the simplicity of the old legends with grotesque satire upon modern subjects. The classicists were the particular objects of his brilliant railery, especially in his *Herzensergießungen eines kunstliebenden Klosterbruders* (1797), written in conjunction with Wackenroder, and *Frans Sternbald's Wanderungen* (2 vols., 1798), and in his comedies *Die verkehrte Welt* ("The Topsy-turvy World") and *Prinz Zerbin, oder die Reise nach dem guten Geschmack* ("Travels after Good Taste"). The *Leben und Tod der Genoveva* (1800) is esteemed his finest drama. Meantime he had married at Hamburg a niece of the composer Reichardt, had become associated with the Schlegels, Novalis, and Steffens at Jena, and with Herder at Weimar, and prepared an admirable translation of "Don Quixote" (4 vols., Berlin, 1799-1801). He published at Dresden in 1802, with A. W. von Schlegel, the *Musenalmanach*. After examining at Rome the manuscripts of German mediæval literature, he returned in 1806 to Munich, and for several years he was disabled by the gout. In 1817 he visited England to complete his studies of Shakespeare and the Elizabethan age. In 1819 he settled at Dresden. In 1820 he was invited by the king of Prussia to Berlin, where, as in Dresden, he exerted great influence on the

drama, and the "Antigone" of Sophocles was performed under his auspices. His works include *Minnelieder aus dem schwäbischen Zeitalter* (1803); *Ulrichs von Lichtenstein Frauen-dienst* (1815); the celebrated novels *Dichterleben*, *Der Tod des Dichters*, and the unfinished *Aufbruch in den Cevennen* (1826); *Shakespeare's Vorschule*, a translation of plays which he regarded as early works of Shakespeare, and *Dramaturgische Blätter* (2 vols., 1826). He also supervised his daughter Dorothea's and aunt Baudessin's continuation of Schlegel's translation of Shakespeare, and edited various poems. The latest edition of his poems is in 3 vols. (1841), and of his novels in 12 vols. (1853). Nearly complete editions of his works include 20 vols. (1828-'42). Carlyle translated several of his tales in vol. i. of his "Specimens of German Romance;" a second edition of those tales, in another English version, appeared at London in 1860. Tiesch's biographer Köpke edited his posthumous writings (2 vols., Leipsic, 1855).—See Friesen's *Ludwig Tiesch* (2 vols., Vienna, 1871). **II. Christian Friedrich**, a German sculptor, brother of the preceding, born in Berlin, Aug. 14, 1776, died there, May 14, 1851. He studied under Schadow and in Paris under David, and was employed at Weimar from 1801 to 1805, and subsequently in Italy till 1819, when he became a member of the academy at Berlin, coöperating with Schenkel and Rauch in improving the art of sculpture. His works include many busts in the Walhalla, executed at Carrara by order of the crown prince and future king Louis of Bavaria; those of Goethe and other poets at Weimar; the statue of Necker for Mme. de Staël; decorations of the royal theatre at Berlin and other public buildings; and the statue of his brother at Dresden.

**TIEDEMANN. I. Dietrich**, a German philosopher, born at Bremervörde, Hanover, April 8, 1748, died in Marburg, Sept. 24, 1808. He studied at Göttingen, and taught ancient languages at Cassel from 1776 to 1786, when he became professor of philosophy at Marburg. He combined the principles of Locke and Leibnitz. His *Untersuchungen über den Menschen* (8 vols., Leipsic, 1777-'98), *Theätet* (Frankfort, 1794), *Idealistische Briefe* (Marburg, 1798), and *Handbuch der Psychologie* (edited by Wachler, Leipsic, 1804), are interesting on account of their investigations in psychology and on the subject of cognition. But his fame rests on his history of philosophy from Thales to Wolf in his *Geist der speculativen Philosophie* (6 vols., Marburg, 1791-'7). **II. Friedrich**, a German physiologist, son of the preceding, born in Cassel, Aug. 28, 1781, died in Munich, Jan. 22, 1861. He graduated in medicine at Marburg in 1804, and was professor of anatomy and zoölogy at Landshut from 1806 to 1816, and afterward at Heidelberg till 1849. His numerous works include *Zoologie* (3 vols., Landshut, 1808-'10); *Anatomie des Fischeherzens* (1809); *Anatomie und Bildungsgeschichte des Gehirns* (Nuremberg, 1816); and *Die Physio-*

*logie des Menschen* (Darmstadt, vols. i. and iii., 1830-'86).

**TIEDGE, Christoph August**, a German poet, born at Gardelegen, Prussia, Dec. 14, 1752, died in Dresden, March 8, 1841. He studied at Halle, and led a precarious life as a clerk in the civil service and as a private tutor and secretary till 1805, when he accompanied the countess Elisa von der Recke in her travels. Subsequently he resided with her at Dresden and Berlin; and at her death in 1833 she directed her establishment to be kept up for him without change. His most celebrated poem is *Urania*, on the immortality of the soul (Halle, 1801; 18th ed., Leipsic, 1862). He also published *Elegien und vermischte Gedichte* (Halle, 1808; 2d ed., 2 vols., 1814). His complete works are in 10 vols. (Leipsic, 1841). Falkenstein published Tiedge's *Leben und poetischer Nachlass* (4 vols., Leipsic, 1841), and Eberhard *Blicke in Tiedge's und in Elisa's Leben* (Berlin, 1844). The Tiedge charitable literary institute at Dresden, originally founded for local purposes, has since 1860 extended its operations all over Germany.

**TIENTSIN, Tientsin, or Tientsing**, a town of China, in the province of Chihli, on level ground at the junction of the Pei-ho with the grand canal, about 65 m. S. E. of Peking; pop. differently estimated from 400,000 to 930,000. It is surrounded by a wall about 4 m. in circuit, and entered by four gates. The principal streets lead from these gates to the centre of the town, and are broad and well paved. The houses are of unburned brick or mud, and have a mean appearance, though some of them are commodious and well furnished. The river is crossed by a bridge of boats, and large suburbs extend for a considerable distance along both banks. Tientsin derives its importance from being the terminus of the grand canal and the port of Peking, and is said to have been formerly a place of great wealth and extensive trade; but since the banks of the canal were broken by the inundation of the Hoang-ho the trade has declined greatly. Treaties were concluded here in 1858 between the Chinese government and the plenipotentiaries of England, France, Russia, and the United States, by which it became one of the 13 ports open to foreign commerce. In 1878 the imports amounted to \$27,602,314; exports, \$12,240,602.

**TIERRA DEL FUEGO** (Sp., "Land of Fire"), a group of islands off the S. extremity of South America, between lat. 52° 40' and 56° S., and lon. 63° 40' and 75° W. It is separated from the mainland by the straits of Magellan, and has the Pacific ocean on the west and the Atlantic on the east, while the E. and W. limits of these seas are supposed to meet at Cape Horn, its S. extremity. The group comprises numerous small islands, of which Cape Horn is the most remarkable; the large island Tierra del Fuego proper, of very irregular shape and nearly 800 m. long E. and W.; the isl-

ands of Navarin and Hoste to the south, separated from the last named by the Beagle channel; and Dawson, Clarence, and Desolation islands to the west. All these islands are deeply indented. They are mountainous, and many of the peaks are more than 5,000 ft. high, while the highest, Mt. Sarmiento, is about 6,900 ft. The limit of perpetual snow is about 4,000 ft. The soil is generally a swampy peat, and to the height of 1,500 ft. is covered with forests of beech. The geological formation is principally clay slate, greenstone, and granite. The climate is one of the worst in the world; storms, sudden gusts of wind, rain, snow, and mist constantly succeed each other. The gigantic seaweed *macrocytis pyrifera* is common on the coasts and in the straits, and affords shelter for innumerable shell fish, without which the natives would find it extremely difficult to subsist. Deer, guanacos, foxes, sea otters, mice, bats, and a few other animals are found, and birds, particularly sea fowl, are numerous. The natives are of the same race as the Patagonians, but smaller, and those of the S. E. portion of the group are short, ill made, and ill looking. Their clothing consists entirely of guanaco or seal skin. Their huts, generally built close to the shore in some sheltered spot, are conical, made of branches or small trees stuck in the earth, 7 or 8 ft. in diameter and 4 or 5 ft. in height, with a small hole for a door.

—Tierra del Fuego was discovered by Magalhaens in 1520, and received its name from the numerous fires seen during the night along the shore. (See MAGELLAN, STRAITS OF.)

**TIERS ETAT.** See STATES GENERAL.

**TIFFIN**, a city and the county seat of Seneca co., Ohio, on the Sandusky river, 77 m. N. by W. of Columbus; pop. in 1870, 5,648. It is an important railroad centre, four lines intersecting here, viz.: the Cincinnati, Sandusky, and Cleveland; Toledo, Tiffin, and Eastern; Mansfield, Coldwater, and Lake Michigan; and Baltimore, Pittsburgh, and Chicago. There are important manufactories, including one of agricultural implements, one of woollens, one of steam engines, &c., two of shoes, two of sash, doors, and blinds, one of wagon hounds, one of furniture, one of stoves, and one of carriages. The city contains a national bank, a savings bank, five public schools, one daily and four weekly (one German) newspapers, and 11 churches. It is the seat of Heidelberg college and theological seminary, founded by

the German Reformed church in 1850. The college has classical and scientific courses. In 1874-'5 there were 10 instructors (2 theological) and 221 students (18 theological, 102 collegiate, and 106 preparatory); the libraries contained 5,000 volumes.

**TIFLIS.** I. A government of Asiatic Russia, in Transcaucasia, comprising the central part of the former kingdom of Georgia; area, 15,614 sq. m.; pop. in 1871, 606,584. (See GEORGIA.) II. A city, capital of the government, and formerly of Georgia, on the river Kur, 1,100 ft. above the level of the Black sea, in lat. 41° 41' N., lon. 44° 50' E.; pop. estimated at 60,000, composed of Russians, Georgians, Armenians, Persians, Jews, Germans, and French. It occupies a long stretch of uneven ground on both sides of the Kur, and is almost surrounded by an amphitheatre of brown barren hills. It is a mixture of Asiatic and European architecture. The modern quarter is laid out in broad streets and open

Tiflis.

squares, and contains the grand-ducal palace, the theatre, public buildings, and residences of the authorities. The old part of the town has narrow unpaved lanes and alleys, mud or sun-baked brick houses with flat roofs and few windows, and vaulted bazaars, and in it is concentrated all the life and business of Tiflis. The town is the headquarters of an army of 150,000 men, employed in frontier duty, in surveillance of the tribes, and to a great extent in making roads. Tiflis is celebrated for its warm baths. The mineral springs are chiefly at the S. end of the city, and the temperature of the hottest is 115° and that of the coldest 75°. These waters are said to be very beneficial in cutaneous disorders and rheumatic complaints. The climate is exceedingly hot, and bilious diseases prevail. The manufactures consist of carpets, shawls, &c.; and a considerable trade is carried on with Persia. A railway, following the upper course of the Kur and the lower of the Rion or Phasis, connects Tiflis with Poti on the Black sea.—Tiflis

was founded in the 5th century by a monarch named Vakhtang, who conquered the territory lying between the Black and Caspian seas, and was the capital of the nominally independent kingdom of Georgia, though devastated by Genghis Khan, and frequently in the possession of the Turks or Persians. Aga Mohammed Khan, shah of Persia, destroyed it in 1795, and reduced a large portion of the inhabitants to slavery. The last king of Georgia ceded it to Russia in 1801, since which its population has more than doubled. An insurrection broke out on June 27, 1865, but was soon suppressed.

**TIGER** (*Felis tigris*, Linn.), one of the largest, strongest, and most active of the cat family, peculiar to Asia. It is usually about 8 ft. long and between 3 and 4 ft. high, but occasionally is considerably larger; the ground color is bright orange yellow, the face, throat, and under parts nearly white, and all elegantly striped with transverse black bands and bars;

Tiger (*Felis tigris*).

it is less high but longer and more slender than the lion, with rounder head and more cat-like form; the colors are brightest in the adult male, the young being grayish with obscure dusky bands; it has no mane. It lies in ambush at early dawn by the sides of springs and rivers for animals as they come to drink; it is able to leap a great distance upon its prey, carrying off a buffalo with apparent ease, a powerful man being as nothing in its jaws; its motions are exceedingly supple and graceful; it passes the day for the most part in a shady covert, gorged and sleepy from the morning meal. Its north and south geographical range is extensive, from northern China to the Malay peninsula, but it is most abundant in the vast jungles lining the banks of the great rivers of Hindostan. In many parts of Bengal it is the terror and scourge of villages, prowling around the outskirts, and attacking cattle in the fold and on the road, though the natives protect them in part by noisy drums by day and torches by night; men and women frequently fall victims. The English rifle has

nearly cleared the thickly settled districts of these animals, against which the native traps and weapons (spears and poisoned arrows) are comparatively powerless. The tiger makes no noise comparable to the roar of the lion, but rather a loud grunting sound. It may be tamed when taken young, but its temper cannot be depended on; it breeds in captivity, though less frequently than the lion; hybrids between the Asiatic lion and tigress have been born in menageries, but have not reached maturity; their color is brighter and the bands better marked than in young lions or tigers of unmixed race. Pliny says the first tiger known in Rome was a tame one belonging to the emperor Augustus.—See Capt. Shakespear's "Wild Sports of India" (London and Boston, 1860), and "The Royal Tiger of Bengal, his Life and Death," by J. Fayrer, M. D. (London, 1875).—The so-called American tiger is the jaguar (*F. onca*, Linn.).

**TIGER BEETLE.** See BEETLE.

**TIGER CAT,** a name commonly applied to several small species of *felina*, in America, Asia, and Africa, especially to those ornamented by bands and bars. Among the American species, the ocelot has been described under that title, and under the same the margay (*Felis tigrina*, Linn.). The *F. eyra* (Desm.) is called tiger cat; it is about the size of the house cat, but with longer neck, body, and tail; it is uniform brownish red, with under jaw and nose spot white, paler below; like the ocelot, it comes from Guiana and as far north as Mexico and Texas. The *F. yagouaroundi* (Desm.) is larger, with a much longer body; it is grizzled brownish gray without spots; hairs ringed and tipped with black; the young more rufous; it extends from Paraguay to Texas. Both of these cats frequent woods and thickets, feeding on small mammals and birds, and are excellent climbers. The chati (*F. mitis*) of South America is also sometimes called tiger cat. (See CHATI).—There are several tiger cats in Asia, of which the largest and handsomest is the rimau-dahan (*F. macro-*

Rimau-dahan (*Felis macrocelis*).

*celis*, Temm.). It is about 8 ft. long, with a tail of 2½ ft. more, and 16 in. high at the shoulders; the head comparatively small, ears

short and rounded, body cylindrical, limbs very robust, tail very full and long, and fur thick and soft; it is ashy or brownish gray, with irregular spots and bands of velvety blackness arranged longitudinally and unbroken along the back; border of mouth black, and feet gray. It is a native of Sumatra, and lives much on trees, hence called tree tiger; the food consists of birds and the smaller deer; it is not very common, and not dangerous.—The animal commonly called tiger cat by the furriers has been described under *SERVAL*. Other tiger cats are *F. minuta* and *F. Diardi*, both inhabiting the islands of the Malay archipelago, and *F. Nepalensis*, inhabiting the Himalaya mountains.

**TIGER FLOWER**, a species of *tigridia*, both names referring (from Lat. *tigris*, a tiger) to the spotted flowers. It is a Mexican genus of bulb-bearing plants, belonging to the iris

family; the long sword-like leaves are much plaited, and the stems, about 2 ft. high, produce a succession of large and very showy but ephemeral flowers. The flowers, 5 or 6 in. across, have three very large outer divisions with a concave base, and together form a cup; the three inner divisions are smaller and fiddle-shaped. The species in cultivation are *T. pavonia*, having rich

Tiger Flower (*Tigridia pavonia*).

scarlet flowers variegated with bright yellow and spotted with black, and *T. conchiflora*, orange and yellow with black spots; there are garden varieties of both, differing in the depth of color and markings. Their cultivation is very simple; the bulbs are planted in any good garden soil after cold rains are over, and taken up at the first frosts, dried, and kept until spring where mice cannot destroy them.

**TIGER MOTH.** See *MOTH*.

**TIGHE, Mary** (BLACKFORD), an Irish authoress, born in Dublin in 1778, died at Woodstock, Kilkenny co., March 24, 1810. She married in 1793 her cousin, Henry Tighe, of county Wicklow, a member of the Irish parliament, and in 1805 printed for private circulation her "Psyche," a poem founded on the story of Cupid and Psyche as related in the "Golden Ass" of Apuleius. It reached a fifth edition in 1816. She died of consumption after several years of suffering. In 1811 appeared a complete edition of her poetical works, containing many devotional pieces.

**TIGLATH-PILESER.** See *ASSYRIA*.

**TIGRANES THE GREAT**, a king of Armenia, ascended the throne about 96 B. C., died about 55. He was a descendant of Artaces, the reputed founder of the Armenian monarchy, and by wars during the early part of his reign united all Armenia under his rule, and conquered in addition several provinces. He also acquired by his war with Parthia two important provinces, which comprised the whole of northern Mesopotamia and the tract east of the Middle Tigris, including Assyria proper and Arbelitis; and by some unknown means he obtained possession also of Media Atropatene. In 88 he was invited into Syria by the inhabitants, who were wearied with the continual strife between the princes of the house of the Seleucids, and he established himself as king over Cilicia, Syria, and most of Phœnicia, residing at Nisibis. About 80 he made the strongly fortified city of Tigranocerta, between the Tigris and Lake Van, his capital. His support of Mithridates of Pontus, his father-in-law, involved him in a war with the Romans. Lucullus gained several victories over them, and captured Tigranocerta. Pompey, his successor, made an alliance with Phraates III. of Parthia, who engaged Tigranes in war on his own frontier, while Pompey marched into Pontus. The occasion for it was offered by the eldest son of Tigranes, of the same name, who had engaged in a conspiracy against the life of his father, and being discovered had fled to Phraates, who readily embraced his cause and marched an army into Armenia. Tigranes fled, Artaxata was invested, and the Parthian monarch withdrew, leaving the young Tigranes as many troops as he thought necessary to press the siege to a successful issue. When Phraates was gone, Tigranes returned, defeated his son, and drove him out of his kingdom. But soon afterward he was forced to submit to Pompey, who in the mean time had defeated Mithridates also. (See *MITHRIDATES*.) Tigranes went to the camp of Pompey, and placed himself as a suppliant at the feet of that general. Pompey would not accept the diadem which he offered him, and treated him in a friendly manner, placing him on the throne of Armenia proper. At first Pompey destined the province of Gordyene for the younger Tigranes, but that prince of-fending him, he made it over to Ariobarzanes of Cappadocia. As the province gave rise to disputes between Tigranes and Phraates, Pompey sent Afranius to drive the Parthians out of it, and gave it to the Armenians. In 64 Tigranes was again at war with the king of Parthia, but the differences between them were composed by the intervention of Pompey. After this he disappears almost entirely from history. He was succeeded by his son Artavasdes or Ardavast.

**TIGRÉ**, a state of Abyssinia, between lat. 12° and 16° N., and lon. 37° 25' and 40° E. It is an elevated plain, which forms the basis of

several mountain ranges and lofty groups, and is drained in the north by the Mareb and in the south by the Tacazze. The plateau itself varies from 3,500 to 9,000 ft. in elevation, and is deeply indented by the ravines which form the beds of the principal rivers. The Tacazze is second only to the Bahr el-Azrek in size among the rivers of Abyssinia. Tigré is divided into many petty chieftaincies or districts; the principal towns are Antalo, formerly the capital, Axum, and Adowa, the present capital. Adowa, the largest town, is the entrepot of trade on the great caravan route between Mas-sowah and Gondar, and has considerable manufactures.—Tigré was for many years an independent kingdom, but in 1855 was conquered by Theodore, king of Abyssinia, who made it a province of his empire. (See ABYSSINIA.)

**TIGRIS**, the second river of western Asia, rises in N. W. Kurdistan, S. of Göljik lake, flows S. S. E. to Diarbekir, thence S. E. to Mosul, and thence S. by E. to its junction with the Euphrates at Korna, where the two form the Shat el-Arab. At its source it is less than 10 m. from the Murad or E. branch of the Euphrates; at Mosul it is about 160 m. distant from the sister stream; near Bagdad it is within 20 m. of it, but near Serut the distance has increased to 100 m. Its total course is estimated at 1,150 m., and its width from Mosul to Bagdad, a distance of about 220 m. in a straight line, averages 200 yards; its current in March flows  $4\frac{1}{2}$  m. an hour. The greatest height is attained in the latter part of May, and it resumes its usual level by the middle of June. It is navigable in the flood time between Diarbekir and Mosul for rafts; below Mosul it is navigable for steamers at all seasons. The Tigris is swifter and in the latter part of its course deeper than the Euphrates, and its volume is generally greater. It has been calculated that the quantity of water discharged every second by the Tigris at Bagdad is 164,103 cubic feet. In its upper course it receives from the mountains W. of Lake Van the Bitlis-tchai or Eastern Tigris, which surpasses it in volume of water. From the Zagros mountains it receives streamlets which often swell into large rivers. The principal of these are the Upper Zab, the Lower Zab, the Adhem, and the Diyalah. The western affluents are insignificant. The course of the branch streams constantly varies, and some of the tributaries are left dry within a few years of the time that they have been navigable. While the low banks of the Euphrates often cause that river to leave its channel, the Tigris, which runs in a deep bed, seldom varies. (See EUPHRATES.)—In antiquity the Tigris was the great river of Assyria, and the eastern boundary of Mesopotamia, and on its banks flourished the cities of Nineveh, Seleucia, and Ctesiphon. The name Tigris is supposed to be derived from the old Persian *tigra*, arrow; its Aramaic name was Digla or Diglath, and the Hebrew Hiddekel.

**TILBURG**, a town of the Netherlands, in the province of North Brabant, on the Ley, 14 m. E. S. E. of Breda; pop. in 1873, 24,345. It has a Protestant and several Catholic churches, and a royal castle. The king owns most of the real estate. It is the principal seat of the Dutch manufactories of wool.

**TILDEN**, Samuel Jones, an American lawyer, born in New Lebanon, Columbia co., N. Y., Feb. 9, 1814. He entered Yale college in 1833, but completed his course at the university of New York, and was admitted to the bar. He was a member of the state constitutional convention of 1846, and also of assembly, and did much to shape the canal policy of the state. In 1855 he was defeated as democratic candidate for the office of attorney general of the state. In 1866 he was chosen chairman of the state democratic committee, and in 1867 was a member of the constitutional convention. In 1869-'70 he was active in the organization of the bar association. In 1870-'71 he was prominent in detecting important frauds in the government of New York city, and in 1872 was a member of assembly. In November, 1874, he was elected governor of New York by 50,317 majority. He has been counsel in many important cases, prominent among which are the Flagg contested election for the comptroller-ship of New York city in 1855; the Burdell heirs against Mrs. Cunningham in 1857; the Cumberland coal case in 1858; and the Delaware and Hudson canal company against the Pennsylvania coal company in 1863.

**TILE**, a plate of baked clay, flat, curved, or hollow, used for covering the floors, roofs, or walls of buildings, and for drains and other purposes. The Assyrians employed them as tablets, writing upon them with a style before baking them. (See CUNEIFORM INSCRIPTIONS.) The Egyptians used tiles for the same purpose, but wrote upon them with ink. They also used tiles for roofing, usually in the form of part of a cylinder, one row being laid with the concave side and the next with the convex side upward, the edge being received in the concavity of its fellow. The Greeks used large flat roofing tiles, sometimes having flanges, with semi-cylindrical ones laid over their lines of junction. The flat tiles were sometimes stamped with brief inscriptions, and the others were ornamented with painted devices. They also used tiles in the construction of tombs and the flues of baths, and for drains. The Romans used them still more generally, and their name *tegula* (from *tegere*, to cover) came to be applied to bricks, which were much more used than tiles. The real distinction between them is the greater fineness of the tile. The roofing tiles were, like those of the Greeks, large and flat, having flanges rising a little more than two inches above the surface, the junction of the flanges being covered by the arched tile or *imbrex*. It was customary to stamp the tiles with inscriptions designating the pottery, the manufacturer, the name of

the estate which supplied the clay, the name of the reigning emperor or of the consulship, and other matters. Thus they have often served as records of important historical events. The tiles used by the Romans for covering interior walls were large thin squares of terra cotta, generally ornamented on one side with incised devices. The tessellated pavements were formed of small cubical tiles called *tessellæ* (the diminutive of *tessera*, from the Gr. *τέσσερες*, four, having reference to their form). Some of these *tessellæ* were not more than one fourth of an inch square, and they were laid to form mosaics. The Romans, like the more ancient nations, made use of large flat tiles in the construction of their graves, and also for grave-stones with inscriptions.—At the international exhibition at Vienna in 1873 there was a rich assemblage of decorative tiles of several countries, many of the specimens being from Great Britain, where the art is now practised in great perfection. Among the latter were Roman tiles and *tessellæ* from mosaic pavements recently excavated at Chichester. There were also glazed decorated tiles (see ENCAUSTIC) from Egypt and Assyria, and Saracenic tiles from Spain; also antique tiles from India and from the mosques of Samara and of the 14th and 15th centuries. In the Indian tiles, brought by Dr. Leitner from Lahore, and taken from old monuments, the colors retained their original vividness. The manufacture in Great Britain dates from mediæval times, doubtless due to imitation of the Roman pottery, and may be divided into two periods. The most ancient tiles were probably made between 1290 and 1380, and those of the second period during the prevalence of the perpendicular style of building. Numerous kilns have been found in the Malvern hills, and it is supposed that Tewkesbury abbey and Worcester and Gloucester cathedrals were furnished by them with tiles. The manufacture is said to have continued in Worcestershire to about 1640. Some of the earliest specimens of tiles in the British museum are from the ruined churches in Norfolk. The designs upon the tiles at that time were chiefly sacred symbols and inscriptions, heraldic devices, and monograms. The material is ordinary coarse red clay, the designs being formed of a lighter-colored clay contained in incisions in the body, and afterward covered with a glazing.—The manufacture of tiles in Holland commenced at a very early period, and in the 18th century large quantities were exported to England for fireplaces. They were also brought to America in the 17th and 18th centuries for fireplaces, hearths, and roofs. Many of them were highly ornamented with various designs. The discovery of transferring designs by printing from paper to earthenware about 1752 created numerous imitations in England, and the demand in that country was in a great measure supplied by home-printed tiles.—What are called dry tiles are made in Great Britain by Prosser's

method. The material is dried and reduced to powder in a mill, when it is placed on slabs of plaster of Paris slightly moistened. It is then passed through fine sieves and subjected to intense pressure in steel boxes, from which the tiles are taken to a hot room and dried for a week or two and then ornamented, glazed, and fired. Drain tiles may be made of ordinary brick clay by various simple machines, moved either by power or hand, usually the latter, as the process is very simple. They are all made upon the principle of forcing the prepared clay through a cylindrical or semi-cylindrical tube over a mandrel. Some of them work the material after it has been passed through a pug mill, while others consist of a pug mill and tile machine combined. The uncombined machines cost from \$100 to \$200, and are capable of turning out by man power from 200 to 300 two-inch tiles per hour, or with one horse about 5,000 large tiles per day. The subsoil where drainage is desirable often contains clay of a suitable quality for their manufacture, and the machines are then taken out upon or near the fields to be drained. (See DRAINAGE, and "Farm Drainage," by Henry F. French, New York, 1865.)

**TILLAMOOK**, a N. W. county of Oregon, bordering on the Pacific ocean, bounded E. by the Coast mountains, and watered by several streams; area, 1,400 sq. m.; pop. in 1870, 408. Tillamook bay affords a good harbor. The coast and rivers abound in fish. The greater portion of the surface is covered with gigantic forests of spruce; there are some small and fertile valleys and hills that afford pasturage. Coal and iron are found. The chief productions in 1870 were 2,899 bushels of wheat, 2,719 of oats, 9,340 of potatoes, 29,840 lbs. of butter, and 764 tons of hay. The value of live stock was \$24,285. Capital, Tillamook.

**TILLANDSIA**, a genus of endogenous plants of the *Bromeliaceæ* or pineapple family, the characters of which are given under **PINEAPPLE**. It was named in honor of Prof. Tillands, a Swedish botanist. The species are numerous in tropical and extra-tropical America, and are mostly epiphytes, with their foliage covered with scurfy scales; some South American species have very handsome white, blue, pink, or purple flowers, and are cultivated as stove plants, either on blocks of wood, in the manner of some orchids, or in baskets or pots of moss. There are eight species in the United States, most of which are confined to Florida, and from growing upon the trunks and branches of trees they are popularly called air plants. The largest Florida species is *T. utriculata*, with a large tuft of leaves about 2 ft. long, which are narrow and recurved at the apex, but are much dilated and concave at the base to form a cup which contains a considerable quantity of water. (See **PITCHER PLANTS**.) Other species have this peculiarity, there being one in Brazil, the water held in the cups of which is the only locality for an aquatic spe-

cies of *utricularia* or bladderwort. The flowers of *T. utriculata* are pale blue, on much branched stems longer than the leaves. Others have very narrow leaves, and are only a few inches high. The most important species, unlike the rest, has slender, thread-like, pendent stems; this is *T. usneoides*, so called from its resemblance in manner of growth to *usnea*, a genus of long pendulous lichens, and is popularly known as long moss, and also as black or Spanish moss; its northern limit is the Dismal swamp in Virginia, and it is found all through the southern states to Texas, and in South America to Chill, as well as in the West Indies. Its much branching stems, 2 ft. or more long, bear recurved leaves 2 to 3 in. long, which are scarcely broader than the stems, and like those are greenish gray; each internode or space in the stem between two leaves is twisted to form a loose spiral of about two

Long or Spanish Moss (*Tillandsia usneoides*).

turns; the flowers, produced at the ends of short branches, are about a fourth of an inch across, and have three bright yellowish green petals; the pod, about an inch long, contains numerous slender seeds, with a long hairy tuft. This epiphyte, draping the trees and swinging in the wind, frequently forms a characteristic feature of the southern landscape, though where very abundant its effect, on account of its sombre color, is not altogether pleasing; recently considerable quantities in the living state have been sold in northern cities for the decoration of rooms; it will flourish in an ordinary greenhouse if hung up in any convenient place. The central portion, or the woody part of the stem, is scarcely larger than a horse hair, which it much resembles also in toughness and elasticity; it is dark brown or black even in the fresh plant. This material is used where it grows for various purposes, and is an article of commerce. The rude method of preparing the moss is to place it in shallow water until the outer covering becomes loosened; after it is thoroughly dried,

it is beaten until nothing is left but the horse-hair-like central portion; of late years the process has been much facilitated by the use of steam; the moss is placed in large tight vats, steamed, and dried, and afterward beaten by machinery, the product being superior to that prepared in the slow way. In the southern states it is twisted into ropes, and woven into horse collars, saddle blankets, and mats of various kinds, and is a common filling for beds; northern upholsterers use it by itself or with hair for stuffing chairs, sofas, and mattresses.

**TILLEMONT, Louis Sébastien le Nain de**, a French historian, born in Paris, Nov. 30, 1637, died Jan. 10, 1698. He was educated at Port Royal, and at the episcopal seminary of Beauvais, became a subdeacon in 1672, and a priest in 1676. In 1677 he went to reside with the recluses at Port Royal; and in 1679 he retired to his estate of Tillemont, between Vincennes and Montreuil. His principal works are: *Mémoires pour servir à l'histoire ecclésiastique des six premiers siècles* (16 vols. 4to, 1698-1712), and *Histoire des empereurs et des autres princes qui ont régné durant les six premiers siècles de l'église* (6 vols. 4to, 1690-1738). His *Vie de St. Louis* was first published by the French historical society (6 vols. 8vo, 1847-'51).

**TILLODONTIA**, a new order of eocene mammals, described by Prof. O. C. Marsh in 1875, apparently combining characters of the plantigrade carnivora, ungulates, and rodents. The typical genus *tillotherium* in its skeleton comes nearest to the bears, but has a dentition partly ungulate and partly rodent.

**TILLOTSON, John**, an English prelate, born at Sowerby, near Halifax, in 1630, died in London, Nov. 22, 1694. His father was a strict Calvinist. At an early age Tillotson became a student at Cambridge, where he was made a fellow in 1651, and remained till 1657, when he became tutor in the family of Prideaux, Cromwell's attorney general. Chillingworth's writings having converted him from Puritanism, at 30 years of age he took orders in the English church, and was successively curate of Cheshunt, rector of Kedington, and preacher at Lincoln's Inn in London. He opposed the proclamation of Charles II. for liberty of conscience, which made him unpopular at court, preached earnestly against popery, and advocated the exclusion of the duke of York. He was the leading member of the commission of 20 divines appointed in 1689 to examine and revise the liturgy. On the accession of William III. he became dean of St. Paul's, and in 1691 archbishop of Canterbury. His marriage with a niece of Cromwell brought him into intimate connection with Wilkins, bishop of Chester, whose posthumous works he edited. His life was written by Dr. Thomas Birch (8vo, London, 1752). He published "The Rule of Faith" (1666) and several volumes of sermons. For the copyright of his manuscript sermons his widow received 2,500 guineas; and many collective editions afterward appeared in 14

and 12 vols. 8vo. His complete works were published in 1707-'12, in 3 vols. fol. (10 vols. 8vo, 1820). A volume of his sermons was translated into French by Barbeyrac, and six volumes into German by Mosheim.

**TILLY, Johann Tserclaes**, count, a German soldier, born in the castle of Tilly, Brabant, in February, 1559, died in Ingolstadt, April 20 (O. S.), 1632. He was educated at a college of Jesuits, first served in the Spanish army in the Netherlands, and in Hungary distinguished himself against the Turks. In 1610 Duke Maximilian of Bavaria appointed him field marshal. On the opening of the thirty years' war he was placed at the head of the army of the Catholic league, and contributed to the victory of Prague, Nov. 8, 1620; in 1621 he drove Count Mansfeld, the staunchest supporter of the Protestant cause, from Bohemia and the Upper Palatinate; in 1622 defeated the margrave of Baden at Wimpfen on the Neckar, and Christian of Brunswick at Höchst; and in 1623 routed the latter once more at Stadtloos. When Christian IV. of Denmark joined the German Protestants, he signally defeated him at Lutter in August, 1626. He next besieged Nordheim, which he took after a hard struggle, crossed the Elbe, and coöperated with Wallenstein in conquering the continental part of Denmark. In 1630 he succeeded Wallenstein as chief commander of the imperial armies. On May 10, 1631, he carried Magdeburg by storm, and allowed his soldiers to burn most of the town and massacre about 25,000 persons. But in the same year (Sept. 7) he was utterly defeated by Gustavus Adolphus at Breitenfeld, near Leipsic, and vainly tried to recover his prestige. He was mortally wounded in an engagement with Gustavus at the river Lech near Rain, April 5, 1632. He declined the title of count of the empire and the principality of Kalenberg, was a devoted Catholic, and boasted of his temperance and chastity.—See Klopp's *Tilly im dreissigjährigen Kriege* (2 vols., Stuttgart, 1861).

**TILSIT**, a town of the kingdom and province of Prussia, at the junction of the Tilse and the Niemen (Memel), which is here spanned by a long bridge, 60 m. N. E. of Königsberg; pop. in 1871, 20,236. The town proper consists of two long streets, and has many fine new buildings, manufactories of paper, machinery, iron, sugar, and leather, and an active trade in grain. After Napoleon's victory at Friedland, he met here for the first time the emperor Alexander (June 25, 1807) on a raft in the middle of the Niemen, and the Tilsit treaty of peace, by which Prussia lost half her possessions, was concluded early in July. (See BONAPARTE, vol. iii., p. 42.)

**TILTON, Theodore**, an American author, born in New York, Oct. 2, 1835. He studied at the New York free academy, and in 1856 became a writer for the "Independent," of which he was editor for many years. In 1871 he became editor of the Brooklyn "Union," and in

1872 founded the "Golden Age," which he edited till 1874. In that year he sued the Rev. Henry Ward Beecher on a charge of seducing his wife, but the trial, lasting six months, resulted in a disagreement of the jury. He is also a public lecturer, and has published "The American Board and Slavery" (1860); a "Memorial of Mrs. Browning," prefixed to an edition of her last poems (1862); "The Fly" (1865); "Golden-Haired Gertrude" (1865); "The Two Hungry Kittens" (1865); "The King's Ring" (1866); "The True Church" (1867); "The Sexton's Tale, and Other Poems" (1867); "Sanctum Sanctorum, or Proof-Sheets from an Editor's Table" (1871); "Tempest-Tossed," a novel (1875); and several pamphlets, including a life of Victoria O. Woodhull.

**TIMBER.** See WOOD.

**TIMES, John**, an English author, born in London, Aug. 17, 1801, died there in March, 1875. In 1821 he became amanuensis to Sir Richard Phillips, publisher of the "Monthly Magazine," to which he contributed "A Picturesque Promenade round Dorking" in 1822. In 1825-'6 he published anonymously a selection of ethical passages, under the title "Laconics." From 1827 to 1838 he was editor of the "Mirror," one of the earliest popular low-priced weeklies. He edited the "Literary World" in 1839-'40, and was one of the editors of the "Illustrated London News" from 1842 to 1858. He compiled "The Arcana of Science and Art" (11 vols., 1828-'38); "Knowledge for the People" (4 vols., 1831-'2); "Year Book of Facts in Science and Art" (31 vols., 1839-'69); and "The Illustrated Year Book" (2 vols., 1850-'51). Among his other publications are: "Things not generally Known" (7 vols., 1856-'67); "School Days of Eminent Men" (1858); "Stories of Inventors" (1859); "Lives of Wits and Humorists" (2 vols., 1862); "English Eccentrics and Eccentricities" (2 vols., 1866); "Nooks and Corners of English Life" (1866); "Wonderful Inventions" (1867); "Notable Things of our Own Time" (1868); "Ancestral Stories and Traditions" (1869); "Abbeys, Castles, and Ancient Halls of England and Wales" (2 vols., 1870); "Notabilia" (1872); and numerous other works.

**TIMBUCTOO**, a town of central Africa, on the borders of the Sahara, about 9 m. from the river Niger, about lat. 17° 40' N., lon. 3° W.; pop. about 13,000, greatly increased during the season of trade, from November to January. It is nearly triangular and about 8 m. in circuit. It was formerly surrounded by a clay wall, but this was destroyed in 1826. The houses are closely packed together, and mostly built of clay and stone; some of them are two stories high, and show considerable taste in their decoration. The port of Timbuctoo is at Kabara on the Niger, which has a vast artificial basin, but is accessible for only four or five months in the year, the stream at other times being too shallow for navigation. The most valuable traffic is by caravans, for which

Timbuctoo is the central station of northern Africa. Gold dust is the great article of trade, but many native products and foreign manufactures are also found here. The merchants of Timbuctoo are generally only agents of those at Mogadore, Morocco, Fez, and other places in northern Africa; and this, with the incessant conflicts of race and religion, prevents the accumulation of wealth. The inhabitants are a mixed population of indigenous negroes, Tuariks, Bambaras, Mandingos, Arabs, and Foolaahs, the governing race. The city dates from the 12th century, but it was long known in Europe only by reports of native travellers, until it was first reached by Major Laing in 1826, and furtively visited by Caillié in 1828. In 1853-'4 Dr. Barth resided there nearly a year.

**TIMOLEON**, a Corinthian general, liberator of Syracuse, born about 895 B. C., died in 337. He was early noted for his patriotism and courage, and in his hatred of tyranny he brought about the assassination of his brother Timophanes, who had usurped power in Corinth. Seized by remorse, he lived for nearly 20 years in utter seclusion. In 344 he took command of an expedition sent out by the Corinthians in aid of the Syracusans. After gaining a victory over Hicetas, tyrant of Leontini, who had formed an alliance with the Carthaginians against Dionysius the Younger, he obtained the support of several Sicilian cities. He marched to Syracuse, and took possession of the island of Ortygia, surrendered to him by Dionysius, who sailed for Corinth. Timoleon retired to Adranum, while Neon, in command of Ortygia, attacked the blockading force of the Carthaginians. These soon began to distrust Hicetas, and suddenly sailed away with their whole fleet and all their troops. Timoleon came at the head of 4,000 men, and took the portion of Syracuse held by Hicetas without the loss of a single man. He gave the inhabitants a democratic constitution, ordered the fortifications to be demolished, and erected courts of justice on their site. In a short time more than 60,000 immigrants and exiles re peopled the deserted town. But in 339 the Carthaginians landed at Lilybæum an army of 80,000 men led by Hasdrubal and Hamilcar. The inhabitants were panic-struck, and with difficulty Timoleon collected 12,000 men and set out for the western portion of the island, where he attacked the enemy just as they were crossing the Cremsius, and, aided by a storm, completely routed them. He soon after overthrew Hicetas and Mamerus, tyrant of Catana, and proceeded in his work of de-throning tyrants until none was left throughout Grecian Sicily. Timoleon declined the supreme power, and withdrew again from public life, residing with his family in Syracuse, in a house voted to him by the inhabitants. Toward the close of his life he became totally blind. When he died, the Syracusan people voted to honor him for all future time with festival matches in music, races, and gymnastics. His

life was written by Cornelius Nepos and Plutarch.

**TIMON**, called **THE MISANTHROPE**, an Athenian who lived in the latter part of the 5th century B. C. In consequence of disappointments in friends, he secluded himself, and admitted no one to his society except Alcibiades. He is said to have died from a broken limb which he refused to have set. He is the subject of Shakespeare's "Timon of Athens."

**TIMOR**, an island of the Indian archipelago, between Flores and Timor-Laut, extending N. E. and S. W. nearly 300 m., with a general breadth of about 50 m.; area, about 11,500 sq. m.; pop. about 200,000. It lies between lat. 9° 30' and 11° 40' N., and lon. 123° 20' and 127° 10' E. The native chiefs on the W. and S. coasts acknowledge the supremacy of the Dutch, who have their principal settlement at Kupang or Oeopang; while those in the E. and N. parts pay tribute to the Portuguese, who have established themselves at Dilli. The coasts are but slightly indented, but the harbors of Kupang and Dilli are safe and commodious. The shores are lined in many places by rocks and sand banks; and several islets intervene between Timor and the island of Flores to the west and Timor-Laut to the east, which are respectively distant about 100 and 250 m. The island is traversed throughout its length by a mountain chain, which attains a height in the north of about 6,000 ft. There are no active volcanoes, nor are there any igneous rocks of recent origin; but Timor peak, near the centre of the island, is a volcanic cone which has been quiescent since 1638. Numerous offsets extend from the main range to the coasts on both sides, so that the surface is almost entirely occupied by mountains separated by narrow valleys, though there are considerable tracts of level ground. The rivers are short mountain torrents; many of them become dry in summer, and the water is unwholesome. The mountains are generally bare and rocky, and there are no forests in the proper sense of the word. The indigenous vegetation is described by Wallace as poor and monotonous. It consists largely of eucalypti, acacias, and sandal wood, with grass scanty on the uplands, and coarse but luxuriant in the moister districts. Rice grows abundantly in the lowlands, and wheat and coffee thrive on the higher slopes and plains. Gold, copper, and iron have been found in small quantities. The animals on the N. W. side of the central range of mountains resemble those on the western islands of the archipelago, but those on the opposite side are strongly allied to the fauna of Australia, which is about 360 m. distant. Besides 15 species of bats, but seven mammals are met with in Timor; these are the common Indo-Malayan monkey, a civet cat, a tiger cat, a species of deer, a wild pig, a shrew mouse, and an opossum. There are 118 species of birds. The common domestic animals of Europe have all been introduced. Fish are plentiful on the coasts;

pearl oysters are found in some places, and a kind of coral much prized by the Japanese is procured on the reefs. The people are of low stature, with very dark complexions and bushy hair, and resemble the Papuan type of mankind. The women weave cloth, and the only manufactures which the men engage in are the construction of canoes, and ornaments for their horses. A considerable trade is carried on, principally from Kupang, and is chiefly in the hands of the Chinese.—Timor was visited by Dampier in 1699. The region about Dilli has been occupied by the Portuguese about 800 years, but the settlement is miserably governed, poorly cultivated, and without roads. The Dutch colony is little better. The natives throughout the island are peaceably disposed toward Europeans, but belligerent among themselves, and practically independent.

**TIMOTHEUS**, an Athenian general, died in Chalcis in 354 B. C. He was the son of the general Conon and a pupil of Isocrates. He was made a general in 378, and in 375 defeated a Spartan fleet near Alyzia. In consequence of his failure to come promptly to the relief of Coreyra, thereby endangering the loss of the island, he had to lay down his generalship and answer the charges brought against him. Though acquitted, he went in 372 to Asia, and entered the service of the king of Persia; but he returned to Athens and was sent on an expedition in support of Ariobarzanes, satrap of Phrygia. Seizing a favorable opportunity, he took possession of Samos for the Athenians, and secured for them a partial control of the Hellespont and the occupation of a large surrounding territory. Timotheus was then appointed to a command including Macedonia, Thrace, and the Chersonese. With the aid of Macedonia he reduced Torone, Potidæa, Pydna, Methone, and various other cities belonging to the Olynthian confederacy, but was unsuccessful in the attack upon Amphipolis. In 363–362 he proceeded against Cotys, king of Thrace, and to the defence of the Athenian possessions in the Chersonese, in which he is said to have been successful; but for some reason not now known he retired from his command. In 358 the cities of Eubœa sent messages to Athens entreating aid against the Thebans, who had despatched a large force into the island. Through the energy of Timotheus, within five days an Athenian fleet and army under his command were in Eubœa, and in the course of 80 days the Thebans were forced to evacuate the island under capitulation. In 356, the second year of the social war, Chares, Iphicrates and his son Menæstheus, and Timotheus were appointed to the joint command of an Athenian fleet. In 354 Chares accused his colleagues of having been the direct cause of his defeat at Chios, and Timotheus and Iphicrates were recalled and accused of treason. Iphicrates was acquitted, but Timotheus was found guilty and fined 100 talents. He retired to Chalcis in Eubœa, where he died in the same

year. His son Conon was permitted to compromise the fine by paying 10 talents for repairing the walls of the city.

**TIMOTHY** (Gr. *Τιμόθεος*, "he who honors God"), a disciple of Paul, and his companion in travel and in preaching. He was a native of Derbe or Lystra in Lycaonia, and the son of a Greek and a Jewess. To prevent the cavils of the Jews, Paul circumcised him. He was set apart to the office of the ministry by the laying on of the hands of Paul and the presbytery. He journeyed through Macedonia and Achaia, and was afterward sent by Paul to Ephesus, whence he accompanied the apostle to Jerusalem, and probably to Rome. In the epistles of Paul written during his captivity at Rome, Timothy is mentioned as being with the apostle. Tradition says that Timothy was the first bishop of Ephesus, and was martyred under Domitian.

**TIMOTHY, Epistles to**, two canonical books of the New Testament, addressed, according to ecclesiastical tradition, by the apostle Paul to his disciple Timothy. They are mentioned by Tertullian, Clement of Alexandria, and Origen. Schleiermacher attacked the authenticity of the first epistle, and after him the authenticity of either the first or both epistles has been doubted by Baur, Reuterdahl (archbishop of Upsal), Meyer, De Wette, Ewald, and others; against whom it has been defended by Thiersch, Wieseler, Reuss, Huther, Bleek, and others. The defenders of their authenticity are not agreed as to the times when the epistles were written. Most of them suppose the first to have been written about the year 65. The second, according to the same writers, was written during the captivity of Paul at Rome, and while he was in expectation of martyrdom. It gives instructions on Christian steadfastness and fidelity (ch. i.); exhorts Timothy to constancy (ch. ii.); warns him against false teachers, invites him to come to Rome, and gives information of many of the companions of Paul (ch. iii. and iv.). The two epistles to Timothy, together with the one to Titus, are comprised under the name pastoral epistles. Among the recent commentaries on them are those of Wiesinger (1850), Ellicott (London, 8d ed., 1864), Huther (3d ed., 1866), and Osterzee in Lange's *Biblework* (2d ed., 1864; English translation by Washburne and Harwood, New York, 1868).

**TIMOTHY GRASS**, an agricultural grass (*phleum pratense*), which takes this name from Timothy Hansen, who cultivated it extensively in Maryland, and brought it into notice. In some parts of the country it is called Herd's grass, a name which leads to confusion, as the red-top (*agrostis vulgaris*) is called Herd's grass in Pennsylvania and some other states; in England it is known as cat's-tail. The genus *phleum* has its one-flowered spikelets in dense spikes; its structure is illustrated under GRASSES. A native species, *P. alpinum*, is found on the higher mountains, but *P. pra-*

*tense* is supposed to have been introduced from Europe, where it is found from the Mediter-

Timothy Grass (*Phleum pratense*).

anean to the arctic regions. It was first cultivated for hay in this country, and the seeds were taken to England as a novelty about 100 years ago; but it is much less esteemed there than with us. Timothy is a perennial, with a rather coarse stem, which in dry soils thickens at the base and becomes bulbous; its average height is 2 to 3 ft., but it sometimes grows to 5 or even 7 ft. It forms the great bulk of the hay crop of the country, and is sown to the neglect of other grasses which are much better suited to some soils. Analysis shows, in 100 parts of timothy hay, 9.7 of albuminoids, 48.8 of carbohydrates, 3 of fat, and 22.7 of crude fibre.

**TIMOUR**, or *Tamerlane* (a corruption of Timour Lenk, *i. e.*, Timour the Lame), an Asiatic conqueror, born at Sebz, a suburb of Kesh, about 40 m. S. E. of Samarcand, April 9, 1336, died at Otrar on the Jaxartes, Feb. 18, 1405. He was the son of the chief of the Turkish tribe of Berlas, which inhabited Kesh, and claimed to be on his mother's side a direct descendant of Genghis Khan. In 1361 he became chief of his tribe, and supported the cause of Hussein, khan of northern Khorasan; and after driving out the Calmucks of the khan of Kashgar he married Hussein's sister. With him he had frequent contentions, and after the death of his wife in 1365 a war broke out between them, which ended in the defeat and death of Hussein, and the taking of Balkh, his capital, in 1369, after a siege of three years. Soon after a general Mongol assembly was held, and Timour was proclaimed khan of Jagatai (Transoxiana), Samarcand being chosen as his residence. He now aspired to the dominion of all the countries once under the power of Genghis Khan, and attacked the neighboring princes in detail. The khan of the Getes, ruling the country between the Jaxartes and the Irtysh, was forced to render homage, and in 1379 the khan of Khiva was conquered. He then undertook the reduction of Khorasan (1380), and received the submission of a part of it, but was met with a fierce resistance by Gaiyath ed Din Pir Ali, whose capital was Herat. His efforts were all in vain, and the taking of his capital by storm led to the conquest of the remainder of the country. All Khorasan was now in Timour's power; but the town of Sebsewar revolted and was stormed, and thousands of its inhabitants were subjected

to a cruel death. Timour now aspired to the conquest of the world. All Persia was soon in his power; the country between the Tigris and the Euphrates, from the sources to the mouths of those rivers, submitted to his authority; and the Christian princes of Georgia also became his tributaries. An invasion of Timour's territory by Tokhtamish, whom he himself had established in the Mongol empire of the north, led to the conquest of Kiptchak. The pursuit of his enemy having led the conqueror of the East into the provinces of Russia, he threatened Moscow, marched to the south, and sacked and burned Azov, at the mouth of the Don. In 1398 he crossed the Indus at the passage of Attok, and, after a long march, in which he massacred 100,000 captives, stood before Delhi, which soon capitulated. He penetrated still further into the country, but was recalled by the news of insurrections in Georgia and adjoining parts, and of the designs of Bajazet, sultan of Turkey. His first care was to crush the rebellion in Georgia, and as the Mongol and Ottoman conquests now bordered upon one another, a collision was soon rendered certain. Timour overran Syria, then a dependency of Egypt, and then stormed the revolted city of Bagdad, July 9, 1401, leaving in the public places of the town a pile of 90,000 slaughtered human beings. At last the two great armies of the sultan and the Mongol conqueror met on July 20, 1402, on the plains of Angora, and the former was totally defeated and captured. (See **BAJAZET**.) Timour's dominions now covered all Asia from the Irtysh and Volga to the Persian gulf, and from the Ganges to Damascus and the archipelago. He made Solymán, a son of Bajazet, ruler of European Turkey, and his brother Musa of Turkey in Asia. The sultan of Egypt also became his vassal. He now retired to Samarcand (July, 1404), and spent two months in festivities, but did not long remain idle. He had planned an invasion of China, from which the house of Genghis had recently been expelled, and previous to his return from his Ottoman conquests had sent an army beyond the Jaxartes to prepare the way for his own advance. At the head of 200,000 veteran troops he began his march, crossed the Jaxartes on the ice, and had gone 300 miles from his capital when he died. His army was disbanded, and the invasion of China was given up. He died after a reign of 35 years, all of which was spent in military operations, and left 36 sons and grandsons and 17 granddaughters. A large proportion of his conquests, especially in the northern and western parts of Asia, were lost immediately by his successors. The glory of his race was revived in his descendant Baber, the conqueror of India.—The great authority for the life of Tamerlane is the Persian history of Sheref ed-Din Ali, to whom the journals of his secretaries were intrusted, and whose work has been translated into French by Pétis de la Croix,

under the title of *Histoire de Timur-Bec, connu sous le nom du grand Tamerlan* (4 vols. 12mo, Paris, 1722). The writings attributed to Timour have been preserved in Persian, and are of questionable authenticity. The work on the "Institutions" of his government, with an English translation and a valuable index, was published at Oxford in 1788 (4to) by Major Davy and White, the professor of Arabic, and has also been translated from the Persian into French by Langlès. The autobiographical "Commentaries" of Timour have been translated from a manuscript of Major Davy by Major Stewart, and published by the oriental translation committee of London. These only contain his life from his birth to his 41st year, no version having as yet appeared of the remaining portions. See also the translation of the narrative of Clavijo, envoy of Henry III. of Castile to Timour, by O. R. Markham (Hakluyt society, 1860), and Lamartine, *Les grands hommes de l'Orient* (Paris, 1865).

**TIMROD, Henry**, an American poet, born in Charleston, S. C., Dec. 8, 1829, died in Columbia, Oct. 6, 1867. He was educated at the university of Georgia, but took no degree, and studied law. During the first years of the civil war he wrote martial lyrics, and early in 1863 joined the confederate army of the west as correspondent of the Charleston "Mercury." In January, 1864, he became editor of the Columbia "South Carolinian," which was discontinued in February, 1865, and revived in Charleston in 1866. He was for a time assistant secretary to Gov. Orr. He published "Poems" (Boston, 1860; enlarged ed. with a memoir by Paul H. Hayne, New York, 1873).

**TIMUQUANS**, a tribe of Indians in Florida, belonging to the Choctaw family, formerly occupying the coast above St. Augustine. The Franciscans established missions among them in 1592, and though these were checked by the massacre of several of the missionaries by the heathen party in 1597, they were revived and continued till the destruction of the missions and mission Indians by Carolina and Georgia in the border wars. Several works for the use of the Timuquan missions and a grammar, chiefly by Father Francis Pareja, a Mexican, were printed in the 17th century; and petitions signed by the chiefs in 1688 show that they had all been educated to some extent. Near the close of the century Dickenson found the missions in a thriving condition and acting as post houses on the route to the English colonies.

**TIN** (Ger. *Zinn*; Fr. *étain*), an almost silvery white, highly lustrous, non-elastic metal; chemical symbol, Sn (Lat. *stannum*, tin); equivalent, 116; sp. gr. 7.29. It is softer than gold and harder than lead; malleable at ordinary temperatures into thin laminæ (tin foil); so ductile at 212° F. that it can be drawn into fine, very flexible wire, which however breaks under a weight of less than one ton per square inch of section; so brittle at 892° F. as to be

broken by a blow or fall; not appreciably affected in density by hammering; fusible at 442° F.; burns in air at high temperature, with white light; volatile at very high temperature; comparatively indifferent to air or moisture at ordinary temperatures; a good conductor of heat and electricity. Melted tin has a strong tendency to crystallize on cooling; and the surface of cast tin, when etched with dilute acid, shows its crystalline texture in figures analogous to the tracery of frost on window panes (*moiré métallique*). The free crystals are monometric, or, when obtained by the electric current, quadratio prisms, showing dimorphism of the metal. A bar of tin crackles when bent (the tin cry, *cri d'étain*, *Zinngeschrei*), and under rapidly repeated flexures the bent place grows hotter than the hand can bear. Both noise and heat are due to the friction of the interior crystal faces upon each other. The handling of tin communicates a peculiar odor to the skin. There are three oxides of tin: the stannous, SnO, stannoso-stannic, Sn<sub>2</sub>O<sub>3</sub>, and stannic, SnO<sub>2</sub>. A certain obscure modification of the last, the hydrate of which is insoluble in nitric or muriatic acid, is called metastannic oxide. The stannic and metastannic oxides form salts with alkalies, earths, and metallic oxides. Muriatic acid dissolves tin as stannous chloride, SnCl, which is used by dyers and in laboratories as a reducing agent, by virtue of its strong affinity for oxygen and chlorine. Dilute sulphuric acid scarcely attacks tin; heating with concentrated sulphuric acid transforms it to stannous sulphate, setting free sulphurous acid; very dilute nitric acid dissolves it cold, without any escape of gas, ammonia being formed simultaneously with the stannous nitrate and held as nitrate of ammonia in the solution. Concentrated nitric acid attacks tin violently, forming the insoluble metastannic oxide, which is the "putty powder" used in enamelling and in polishing plate. *Aqua regia* dissolves tin as stannic chloride, SnCl<sub>4</sub>. Alkalies cause oxidation of tin, forming stannic acid, which unites with the alkaline bases. Thus, tin being heated in concentrated caustic soda solution, hydrogen is set free, and sodic stannate is formed. This is extensively used as a mordant, the basis of the "tin-prepared liquor" of dyers and calico printers. Sulphuretted hydrogen does not attack massive tin at ordinary temperatures. There are three sulphides of tin, of which the stannous or protosulphide may be obtained by heating sulphur and tin together; the second, sesquisulphide, by heating the first with additional sulphur; and the third, bisulphide, by a similar process. In the last case, the high temperature, which would otherwise decompose the bisulphide, must be kept down by adding to the ingredients volatile substances (mercury, sal ammoniac), which in escaping will absorb heat. This sulphide, thus produced, presents delicate golden or brownish yellow scales, and is used as a bronze powder

(mosaic gold, the *aurum musivum* or *mosaicum* of the alchemists). A mixture of stannous and stannic chloride, added to gold chloride in solution, precipitates a purple powder, supposed to be stannic oxide, colored by metallic gold in fine particles, or a mixture or combination of the oxides of gold and tin. It is known as the purple of Cassius, and is used for coloring porcelain and glass, with which it is incorporated by fusion. The amalgam of tin and its alloys with lead and other metals is employed in the arts. (See AMALGAM, BRITANNIA METAL, BRONZE, MIRROR, PEWTER, and SPECULUM.)—*History.* Tin ore, being a heavy mineral, not altered by ordinary meteoric agencies, may occur in alluvial and diluvial deposits, like gold and precious stones; and being also, when pure, easily reduced by smelting, its treatment might naturally become known to nations of great antiquity. It is often said that the Hebrews, Egyptians, and Greeks employed this metal; but so far as the question turns upon the Hebrew *bedil* (Ezek. xxvii. 12; Numb. xxxi. 22; Isa. i. 25, &c.) and the Greek *κασσίτερος*, which have been translated as tin, this seems doubtful. Tin was certainly often confounded with lead, being called by the Romans *plumbum candidum*. Even the *stannum* of Pliny was not tin; and not until the 4th century does *stannum* definitely bear this meaning. (See Kopp's *Geschichte der Chemie*.) But bronze vessels found at Thebes are said to be in part composed of tin, which Wilkinson suggests the Egyptians may have obtained from Spain or India long before the Phœnicians voyaged in the Atlantic. The latter people brought *κασσίτερος* from the Cassiterides, supposed to have been the Scilly islands, off the coast of Britain. This may have been brought to the Scilly islands from Cornwall, or else, it is presumed, the Phœnicians pretended to visit these islands, and gave them a deceptive name, in order to mislead the Romans and conceal their real trade on the Cornish coast. (See "Transactions of the Geological Society of Cornwall," vols. iii. and iv.) Spain also is believed to have furnished tin to the Phœnicians. In the middle ages Cornish tin was used for church bells, and later for bronze cannon. The ancient Mexicans obtained tin from the mines of Tasco, and with it made bronze for very hard cutting tools; and they used small T-shaped pieces of tin for money. Cortes had bronze cannon made with the tin of Tasco.—*Distribution.* Native metallic tin is one of the rarest of minerals. It has been reported from Siberia, Bolivia (doubtful), and Pennsylvania. (See Gent's recent volume on the mineralogy of that state.) There is a native sulphide (stannine, tin pyrites), but the only ore commercially utilized is the stannic oxide, called tinstone or stannite,  $\text{SnO}_2$ ; sp. gr. 6.94; crystalline form, tetragonal pyramids; percentage of tin, 78.38; crystals yellowish and translucent when pure, but usually dark brown, al-

most black, from admixture of ferric and man-  
ganic oxide. This occurs in veins, beds, and *Stockwerke*, or in secondary (alluvial and diluvial) deposits. In the former case, it is found in quartzose crystalline rocks (granite, gneiss, porphyry, mica and hornblende schists, quartz-porphyry, &c.), associated with arsenical pyrites, iron and copper pyrites, bismuth, zinc blende, wolfram, molybdenite, specular iron, &c., and with such earthy minerals as feldspar, tourmaline, chlorite, topaz, apatite, fluor spar, and scheelite. The leading localities where such deposits have been worked are Cornwall and the Saxon and Bohemian Erzgebirge. Tin veins also occur in Brittany, Finland, Spain, Mexico, Bolivia, and New South Wales. The placer deposits are illustrated at the islands of Banca and Billiton in the Malay peninsula, and at some other points in the East Indies. The tin placers of Australia have also furnished of late large quantities of tin ore; and such deposits (stream tin) occur subordinately in Cornwall, Brittany, Spain, and elsewhere. A remarkable deposit of tin ore in a dike of trachyte is said to exist in Durango, Mexico. Stannite occurs with cryolite in Greenland. Tin ore in veins, dikes, or beds of dark porphyry is found in San Bernardino county, southern California; specimens are said to have been found in Idaho, in the bed of a stream; and several localities in the Appalachian regions are known to mineralogists as furnishing the ore in occasional crystals or in thin veins. Chesterfield and Goshen, Mass., and Lyme and Jackson, N. H., are localities of stannite; and tin has been detected in the magnetic iron ore of the highlands of New York and New Jersey, and in some of the auriferous ores of Virginia. The tin-ore deposits of Missouri, the object of a considerable speculative excitement a few years ago, seem to consist in the replacement to a minute extent, in certain crystalline schists, of titanite by stannic acid, the two being isomorphous. The relative importance of the chief tin-producing regions is shown by the following estimates of production in tons:

REGIONS OF PRODUCTION.	1872.	1873.	1874.
United Kingdom .....	9,560	9,970	10,000
Banca .....	8,203	4,835	4,049
Billiton .....	2,846	2,360	8,157
Malacca .....	9,735	6,968	7,149
Australia .....	150	2,990	3,300

The amount credited to Great Britain includes the tin produced in that country from imported Australian ores. The product of Bolivia or Upper Peru, known as Peruvian tin, was estimated in 1868 by English authorities at 1,500 tons; but it is probably much less at present, since no account is taken of it in the trade reports. Saxony and Bohemia produce an insignificant quantity, not more than 200 or 300 tons in all; and Spain yields still less.—In the tin mines of Cornwall the ore occurs in small

strata, veins, or masses ("tin floors"); in congeries of small veins; in large veins; and disseminated in alluvial deposits. The congeries or networks of small veins (*Stockwerke* of the Germans) occur in granite and "elvan" (feldspathic porphyry). The large metalliferous veins are grouped in three districts: the S. W. part of Cornwall, beyond Truro; the neighborhood of St. Austell; and the neighborhood of Dartmouth, in Devonshire. The first is the richest and best explored. The tin veins belong to different systems, having nearly the same general course, but differing in dip. It was formerly thought that tin occurred in the upper portions of the lodes only, and the appearance of copper pyrites in depth was considered to be a sign that the tin ore had been "cut out;" but more recently tin ore has been found at great depths and below the copper. Thus the Dolcoath mine was worked first as a tin mine for a very long period; then as a copper mine for half a century; and finally again, at still greater depth, and with considerable profit, as a tin mine. Alluvial tin ore or stream tin deposits occur on the hillsides and in the valleys, and furnished for centuries the whole of the Cornish tin. The largest works of this kind are around St. Just and St. Austell. Many of the Cornish mines have been unprofitable since 1872, on account of the great fall in prices resulting from the influx of Australian ore and metal. The mines in the East Indies might perhaps have brought about this revolution still earlier, since they were capable of producing tin very cheaply; but the supply from that source was limited at the will of the governmental authorities, so as to divide the market with Cornwall, on terms which left some profit to the Cornish mines. One authority estimates the product in 1868 at 7,200 tons for Great Britain, and 7,500 tons for southern Asia and India. According to a recent writer (*Berg- und Hüttenmännische Zeitung*, 1875), the total product of tin in the world about 1870 was something over 11,000 tons annually, of which 6,000 tons came from Cornwall and 4,000 tons from Asia. (This estimate for Asia is apparently too low.) But since that time, and especially since 1872, a very extraordinary development of tin mining in Australia has revolutionized the market.—The Australian tin-ore deposits thus far known occur in the region of the Cordilleras, in Victoria, New South Wales, and Queensland. In Victoria the older outcropping rocks are predominantly Silurian, and tin ore is found in small quantity in alluvial deposits, but hitherto not in veins. In New South Wales and Queensland there is a greater quantity and variety of exposed rock formations, and among them granites, porphyries, and metamorphic schists, with which the tin ore is associated. In a portion of New South Wales it appears connected with more recent eruptive rocks. The alternations of rain and drought in the seasons are a serious inconvenience to alluvial

mining, which suffers also, like the placer mining of gold in Australia and the United States, from occasional excessively dry years. The existence of tin ore in this region was made known by the Rev. W. B. Clarke, colonial geologist, in 1845; in 1869 a shepherd brought to market a considerable quantity which he had obtained by washing, without knowing its value; a population of 10,000 miners was attracted to the district, and a feverish speculation raged until near the end of 1871, followed by disastrous reaction and a gradual renewal of industry in a more reasonable way. Up to the end of 1871 the production had been about 2,000 tons of tin. The present export in metal and in ore (sent to England for reduction) is said to exceed 7,000 tons of tin; the number of workmen is between 2,000 and 3,000. Veins are abundant, but the entire product is at present derived from alluvial mines. These occur in five principal districts, interspersed with scattered minor districts, the aggregate area being about 1,000 sq. m., the greater part of which lies south of the boundary between Queensland and New South Wales. The placers usually lie along present or former water-courses, and present at the surface granitic sand and pebbles, with underlying gravel, and at the bottom, resting upon the bed rock, a layer of clay, gravel, and boulders, in which occur tin ore, wolfram, tourmaline, quartz, and occasionally sapphire and ruby. Sometimes the series is repeated, giving two layers of stanniferous gravel, of which the lowest rests upon the rock, a phenomenon familiar to placer miners for gold; and the methods of working are similar to those of the latter. The total depth of the deposit is rarely less than 4 or more than 20 ft. The labor employed is partly Chinese; the average cost of the ore, delivered at the nearest harbor, is perhaps £40 a ton, though rich mines, favorably located, can deliver it at £30. Some furnaces have been erected near the mines to smelt the ore; but wood, the only fuel available there, though cheap at present, is likely to be rapidly exhausted. Two large establishments, at Sydney and Brisbane, have successfully smelted the Australian tin ores with coal in reverberatory furnaces. The metal, however, even after refining, contains but 99 per cent. of tin, on account of the wolfram invariably present in the ore. For this reason Australian ore is disliked by the smelters of Cornwall, and Australian tin always commands a somewhat lower price than Banca or Cornish metal. New and extensive discoveries of tin ore have been recently reported in Tasmania.—The tin ore of the island of Banca, in the Dutch East Indies, occurs as stream tin and also in veins in granite. The Dutch government at present works the alluvial deposits only. These consist of 9 to 30 ft. in depth of loam, red and blue clay, coarse and fine sand, and tin ore. The tin-bearing layer is from 8 to 22 in. thick, in some cases even more. The mines are worked du-

ring the dry season of eight months, the rainy season being devoted to smelting the ore. The workings are open pits and cuts; and the material is conveyed away to be washed, water being collected by means of dams and reservoirs. After the washing the ore is calcined, leached in water (to remove sulphates of iron and copper), smelted in shaft furnaces with charcoal, drawn into a purifying receptacle, and poled. The resulting tin is the best in the market. The government furnishes engineers, superintendents, and furnaces; all the rest is supplied by the workmen (Chinese), who receive about \$5 09 for each 100 lbs. of cast tin. The "Straits" tin comes from the British settlement of Malacca, and from various points on the Malay peninsula and the islands between it and Java. Drought and troubles with the Malays have temporarily reduced the supply from this source. Its quality varies according to the locality of the mines and the skill of the metallurgical treatment; but it is usually less pure than Banca tin.

—*Metallurgy of Tin.* The tin ore found in drift or alluvium is usually purer than that in veins, because the arsenides, sulphides, and metallic salts are decomposed and carried away by the action of water. The vein stuff as mined is usually rock or gangue containing disseminated ore (sometimes as little as  $\frac{1}{4}$  of 1 per cent. of tin), and requires a careful preliminary concentration, the difficulty of which is enhanced by the presence of heavy minerals (wolfram, bismuth, &c.), which must be removed to secure a pure metal as the result of smelting. Connected with the mechanical concentration there is usually a calcination, to convert heavy sulphides into oxides, which can be more easily washed away. The apparatus of concentration comprises launders, plane tables, buddles, percussion tables, jigs, &c. (See METALLURGY.) The theory of the reduction of tin ore is simple. The stannic oxide must be deprived of its oxygen by contact with carbon at high temperature, and reduced to metallic form in fusion, while the earths and metallic oxides accompanying it must be collected in the slag. In practice the operation is embarrassed by several difficulties. One of these arises from the high temperature necessary for the reduction of the stannic oxide, at which temperature other metallic oxides, which should pass into the slag, are also partially reduced and enter the metallic bath, or cause "salamanders" or "scaffolds" by chilling in the furnace. Hence the necessity of removing lead, bismuth, copper, antimony, arsenic, zinc, iron, tungsten, molybdenum, &c., as far as practicable, before smelting. There is also danger that the stannic oxide, which plays the part of an acid toward many bases, and of a base toward acids, may pass partly into the slag as ferrous or calcic stannate, or stannic silicate. The oxidability and volatility of tin are also sources of loss, to avoid which the shaft furnace is so constructed as to remove

the metal, once reduced, as soon as practicable from the influence of the heat and blast. The earthy ingredients of the ore, in which usually silica predominates, tend to form "stiff" (not easily fusible) slags; and, rather than add fluxes to counteract this evil, at the cost of an increase of the amount of zinc carried into the slag, it is common to smelt with little or no extra flux, producing a scarcely fused slag, in which more tin is mechanically caught and retained than is chemically combined with silica or the bases. This slag may be remelted or treated by mechanical concentration, to extract the tin which it contains, in fine metallic grains. Wolfram, which cannot be completely washed out, either with or without preliminary roasting, and which if present in the smelting charge goes partly into the slag and partly as tungsten into the metallic tin, is sometimes removed by a preliminary smelting of the ore with sodic carbonate or sulphate (Glauber's salt), by which a soluble tungstate of soda is formed, which can be leached out. Muriatic acid will leach out from roasted tin ore the chlorides of iron, copper, and bismuth.—The melting of the concentrated and purified tin ore may take place in a reverberatory or in a cupola furnace. The former is advantageously employed where coal is cheap and good. It loses less tin by oxidation than the shaft furnace, in which the blast acts more or less on the tin, and it requires less fuel for the production of a given amount of tin. Zirkel says the reverberatory consumes for each part of tin produced  $1\frac{1}{2}$  part of coal and loses 5 per cent. of tin, while the shaft furnace consumes 3 parts of coal and loses 15 per cent. of tin. But when the ore is impure, the reverberatory furnishes an inferior tin. The greater product is due to the better opportunity afforded for the grains of tin to settle from the slag into the bath, which in the shaft furnace must be quickly removed to prevent oxidation from the blast. But this oxidizing blast, on the other hand, removes more completely arsenic, bismuth, &c. The principal ingredients added in the reverberatory are reducing agents (carbon), and sometimes, to counteract predominant silica in the ore, small quantities of slacked lime and fluor spar. This furnace is used in England, and also in Australia. In the cupola furnace, which is employed on the continent of Europe and in the Indies, the additions, aside from the fuel, are chiefly stanniferous slags and residues from the same process, which serve to prevent the fine dressed ore from packing too closely in the furnace to permit the passage of the blast. The cupola furnaces are made comparatively small in section, and contracted near the tuyeres, in order to secure the necessary temperature; and to prevent the reduction of iron oxides, they are made low (in Saxony, 1'88 to 2'82 metres; in Banca, 1'26 to 2'82 metres). The hearth slopes at the bottom from the rear wall toward the breast, and the fused material, flowing down this slope, passes con-

tinually under the front wall and into a receptacle before it, cut in stone and lined with clay and charcoal powder. Here the metal separates and settles, away from the influence of the blast. Such a shaft furnace (Saxon) is shown in the accompanying section, in which

Saxon Shaft Furnace.

dered charcoal, *l*; *m*, the tapping duct, ending in an opening in the iron front plate *p*; *n*, the crucible or refining pot. The arrangements for removing the slag from *i*, and the chambers for saving dust and fumes, placed above the furnace, are not shown in the diagram. The dimensions of the furnace here shown are, in metres: height, 2·88; width at top 0·96, at bottom, front, 0·58, and rear, 0·48; depth from front to rear wall at top 0·62, at bottom 0·48; inclination of hearth, 26°; size of "eye," 0·10 high by 0·38 at top and 0·5 at bottom; depth of fore hearth 0·38, of crucible 0·4; diameter of each, 0·5. The product of the shaft or reverberatory furnace contains more of less of the impurities of the ore. Of iron there are at least traces in all sorts of tin; 0·5 per cent. injures the silvery color and lustre, and 1 per cent. diminishes perceptibly the softness and smoothness. Of copper, 1 to 1·5 per cent. makes tin harder and less malleable; and as the proportion is increased, the metal becomes more brittle and suffers a change in lustre. Of antimony and bismuth, 0·5 per cent., without affecting the lustre, causes a brittle, crystalline structure. Of lead, 1 per cent. injures color and lustre, and softens the tin. Arsenic to the amount of 0·5 per cent. affects color and lustre; over 1 per cent. of it renders the tin lighter, and gives it a spotted, dull, or darkened appearance. Wolfram and molybdenum in considerable proportions diminish rather the fusibility than the strength or lustre; zinc renders the metal harder, more brittle, and whiter; sulphur makes it "short;" tin oxide reduces its brilliancy; quicksilver, contained in several

varieties of East Indian tin, renders it crumbly, and hinders its union with other metals. The refining of crude tin is conducted in England as follows: The blocks of tin are set on the hearth of a reverberatory, and liquated at low temperature, by which process a purer tin is obtained in a kettle, while an alloy consisting mainly of less fusible metals (iron, wolfram, copper, &c.) remains on the hearth. The liquid tin in the kettle is further purified by "poling;" that is, green wood or damp coal is submerged in it, causing by the generation of gases a violent ebullition, which continually changes the surface of the bath exposed to the air, and promotes the oxidation of the foreign substances. These are skimmed off, and the bath is allowed to settle, when there is a further deposit of heavy metals (iron, copper, &c.) on the bottom. After settling, the tin is drawn off in three portions, the upper layer being refined block tin, the middle common tin, and the lowest an impure alloy which is again liquated. Block tin is cast in moulds of marble. The purest metal (containing only 0·01 per cent. of iron) is called grain tin, and is produced by heating the best block tin until it is brittle, and dropping it from a considerable height upon flat stones. The German process of refining consists in pouring the melted crude tin from a certain height upon an inclined cast-iron plate, coated with loam and covered with a layer of glowing coal about 0·25 metre thick. The less fusible impurities remain among the coals, and the purified tin flows along the plate, to be collected in a sump of cast iron filled with coal. The operation is performed repeatedly; the coals are subsequently beaten, to remove adhering grains of tin, and the residue is returned to the smelting furnace. Care must be taken to cast tin at the right temperature. If too hot, it becomes iridescent and "red-short;" if too cold, it assumes a dull appearance, becomes "cold-short," and loses ductility. The proper moment for casting is shown by a mirror-like clearness of the surface of the bath. A special refining of tin in the humid way consists in dissolving the granulated metal in muriatic acid, and precipitation by zinc. The zinc solution is subsequently decomposed with milk of lime, and the precipitate manufactured by heating into zinc white.—The following analyses are from Kerl's *Metallhüttenkunde* (Leipsic, 1873):

—*Uses of Tin.* Tin foil is used for coating the backs of mirrors, wrapping articles requiring to be kept from the air, lining boxes, covering Leyden flasks, &c. The latter uses require less copper in the composition, and the material is sometimes called stanniol. Of the following four analyses by Stötzl, the first two are of foil for large mirrors, the third for small mirrors, and the fourth for wrappers and linings:

Tin foil is prepared by rolling cast tin into plates, and beating and doubling as with gold foil, though by a simpler process. (See GOLD-BEATING). Tin foil consisting of a surface of tin, with an interior of lead or tin-lead alloy, is prepared by placing a plate of lead or alloy in a mould slightly larger, casting tin around it, and rolling and hammering. Tin-lined lead pipe for plumbers' use is made by setting a core of block tin in the centre of a mass of melted lead, so that the more fusible tin is melted, but does not mix with the remainder of the bath, and then proceeding as in the ordinary manufacture of lead pipe. (See LEAD, vol. x., p. 262.) Tin plating is performed either by covering the metallic articles to be plated with melted tin, or by humid processes. The former method is chiefly confined to copper, iron, and zinc. Copper may be heated, cleaned with sal ammoniac, sprinkled with resin to prevent oxidation, and then plated by pouring melted tin upon it, and spreading the tin with tow, a high temperature being maintained. The plating of sheet iron, to form so-called "tin plate" or sheet tin, for domestic utensils, &c., is conducted as follows: The thin sheets of iron are cleaned by immersion in dilute sulphuric acid and subsequent rubbing with sand and water and washing, after which they are annealed by exposure to cherry heat for 12 hours in cast-iron boxes, tightly closed and luted. Imperfect or seriously oxidized plates are rejected. The accepted ones, which are purplish from a thin external film of oxide, are polished by being passed cold through rolls, then subjected to a second and less prolonged annealing, then sorted and cleansed again, and finally taken to the tinning apparatus. After cleansing they will quickly rust on exposure to air, but may be kept indefinitely without injury if immersed in pure water. The tinning apparatus comprises a series of long rectangular pots or tanks, with a fire under each. These tanks contain the liquid baths into which the plates are to be plunged. The operation comprises a series of immersions: first into melted grease, in which the plates are left till all moisture has evaporated; then successively into several baths of tin, each of which is purer

than the preceding, so that the sheets acquire a coating first of alloy and finally of pure tin; then into melted grease again, in which the superfluous tin runs off, while the liquid grease prevents a too rapid cooling and consequent cracking of the surface. As the tin in the final tin bath becomes fouled by alloyed iron, it is removed to the preceding tin bath, and from this in turn to the first bath. After the final grease bath (tallow and palm oil), which anneals the plates, the edging of tin which usually forms around them is removed by dipping into melted cast iron, which melts it, so that a quick blow on the plate causes it to drop off. The plates are at last rubbed with bran and then with sheepskin to remove grease and dirt, sorted, packed in boxes, and marked to indicate size and quality. The sheet iron for tin plates is rolled from the best charcoal or coke bar. Terne plates have, instead of tin, a coating of tin-lead alloy, containing from one third to two thirds lead. Iron may be coated with zinc first, and then very readily tinned by dipping into the fused metal, since tin and zinc unite with ease. Sheet zinc is tinned in the same way, but should not be left in the bath so long as to become alloyed with tin beyond the surface. Lead and its alloys may be tinned in like manner. The process above given for tinning iron is not applicable to cast iron, unless it has been decarbonized on the surface by heating in iron oxide, after the manner of the "annealing" practised in the manufacture of malleable castings. The humid methods of plating tin upon various metals are numerous. Pins, which are made of brass wire, and other objects of brass or copper, are dipped into an aqueous solution, containing 1 part argal, 2 parts alum, and 2 parts salt, in which tin has been dissolved, or to which stannous chloride has been added. In this liquid they remain unaffected until brought into contact with metallic tin, whereby an electro-chemical action is caused, and all the objects connected directly or through one another with the metallic tin are immediately coated with tin reduced and precipitated from the solution. Boiling brass or copper objects, in contact with tin filings, in a solution of stannic oxide in caustic potash, is also an excellent way. Iron objects (nails, hooks and eyes, &c.) may be tinned, after suitable cleansing, in a bath of argal and stannous chloride, with the addition of zinc filings; or the bath may be composed of equal parts of the tin salt and common salt, dissolved in water, or of 1 part tin salt,  $\frac{1}{2}$  part sal ammoniac, and 1 part common salt, dissolved in 2 parts nitric and 4 parts muriatic acid, diluted with water. In the latter liquid most metallic objects may be tinned by sufficiently prolonged immersion, copper or iron being kept in contact with a zinc wire during the process. Zinc is most easily tinned. For galvanic tinning a weak battery may be employed, and a solution of stannic chloride in caustic potash. But the use of the battery in this and similar opera-

tions on a commercial scale will doubtless be superseded by the modern magneto-electric machines, which furnish the necessary current by mechanical instead of chemical means; or, to speak more accurately, by the combustion of coal, a cheap fuel, instead of the combustion of zinc or other expensive substances.

**TINAMOU**, a name applied to the *tinamidae*, a family of gallinaceous birds peculiar to South America. The bill is moderate, rather straight, flattened, the base covered by a membrane, and the tip suddenly hooked; wings short and concave; tail short or wanting; tarsi rather long, scaled in front, and without spurs; toes long, with stout blunt claws, the hind one sometimes wanting. They live in the fields on the borders of woods, are low and heavy fliers, but rapid runners, and feed on grains, fruits, and insects; they lay about a dozen eggs, on the ground in tufts of grass, and the young when hatched soon disperse; when pursued they endeavor to hide in the bushes, and are often caught by a noose on the end of a stick; their

Tinamou.

flesh is exceedingly good; they vary from 6 to 18 in. in length, and are usually of a reddish or gray brown. In the genus *tinamus* (Lath.; *crypturus*, Illig.), the bill is shorter than the head, the upper mandible the longer, and the nostrils in the middle; first quill short, fourth and fifth longest; hind toe small and elevated. The great tinamou (*T. Brasiliensis*, Lath.) is about 15 in. long, of a deep olive color, slightly and narrowly banded with black, with crown red and secondaries red and black; pale reddish ash below; it is found in Guiana and Brazil, resembling in size, habits, colors, and quality of flesh the partridges of the old world; though gentle and timid, it is said not to be capable of domestication. The males have a trembling plaintive whistle to warn of danger or attract the females; they live in couples during breeding time, at other seasons in small flocks. The nest is made on the ground in a slight hollow, covered with dry grasses; they lay twice a year; the young follow the parent as soon as hatched. Other genera are *rhynchotus* (Spix), with the species *R. rufescens* (Wagl.) or rufescent tinamou, inhabiting the

borders of lakes and the swampy thickets of Paraguay in small troops; and *tinamotis* (Vig.), with three or four species, found in high desert places, some distance from fresh water.

**TINCTURE**, a solution of a vegetable, animal, or in some cases mineral substance in alcohol, dilute alcohol, or ether. As tinctures present the active principles of many drugs in a small bulk, and are little liable to change, they are largely used in medicine. They are made by maceration or displacement. The former process consists in soaking the drug for a time which varies greatly in different cases. Displacement or percolation is largely employed in the preparation of fluid extracts as well as of tinctures, and consists in allowing the fluid employed to filter slowly through the powdered drug, the lower layer of fluid, containing a large portion of the soluble constituents, being constantly drawn off and its place supplied by fresh strata from above. This process is in most cases much more rapid than maceration. Tincture of iodine and tincture of the chloride of iron demand no maceration, as iodine dissolves rapidly in alcohol or ether, while the iron preparation is a mere mixture of a solution with alcohol.

**TINDAL, Matthew**, an English author, born at Beer-Ferri, Devonshire, about 1657, died in London, Aug. 16, 1733. He was educated at Oxford, took the degree of bachelor in 1676, and was elected to a fellowship at All Souls, which he retained through life. He was created LL. D. in 1685, and soon after became a Roman Catholic, but returned to the church of England just before the revolution of 1688. After the revolution, of which he was a zealous partisan, he became an advocate, sat as judge in the court of delegates, and received a pension from the crown of £200. In 1706 he published "The Rights of the Christian Church asserted, against the Romish and all other Priests that claim an independent Power over it," in opposition to high church principles. This excited a long controversy, during which he published two defences, which he reprinted in 1709, with essays on obedience and the law of nations, the liberty of the press, and the rights of mankind in matters of religion. In 1710 he attacked the party of Dr. Sacheverell in a pamphlet entitled "New High Church turned Old Presbyterian," but the house of commons on one day condemned Sacheverell's sermons, and on the next ordered Tindal's "Rights of the Christian Church" and the second edition of his "Defences" to be burned. His most important work is "Christianity as old as the Creation, or the Gospel a Republication of the Religion of Nature" (1730), in which he expressly denies that Christianity contains any truth which the human reason might not have discovered for itself. Waterland, James Foster, Conybeare, Leland, Chapman, and others wrote replies to it. He left a second volume of this, only the preface to which has been published.

**TINDALE, William.** See **TYNDALE.**

**TINGHAL.** See **CHUSAN.**

**TINNÉ**, the northern branch of the great Athabascan family of American Indians, being the most northerly of all except the Esquimaux. They live north of lat. 55°, and extend from central Alaska to Hudson bay. They embrace several large divisions, differing in language: 1, the Chippewyans or Pointed Skins, called Montagnais by the French, including also the Caribou Eaters and Yellow Knives; 2, the Beaver Indians, on the west, the Mauvais Monde, and Sarcees; 3, the Dog Ribs, Slaves, Hares, Nahaunes, Red Knives, Sheep, Brushwood, and Rocky Mountain Indians, all E. of the Rocky mountains; 4, the Tacully or Carriers, including the Sicaunees in British Columbia; 5, the Kutchin Dekedhé or Loucheux; 6, the Kenai, including the Atnas in Alaska. They are generally mild, timid, and honest, live on fish or reindeer and other animals, more frequently snared than hunted, and do not attempt to cultivate the ground. They are tall and slim, with a full face, dark complexion, and piercing eyes, and have more beard than other Indians. Their weapons and implements are generally rude, made of bone or stone; but some tribes make excellent water-tight vessels of roots. Their *jkanees* or medicine men have great influence. The Chippewyans leave the dead unburied, but the Tacullies burn them. The estimates of their numbers vary; those east of the Rocky mountains are estimated by Archbishop Taché at 15,000. Catholic and Protestant missions have been established among them in various parts.

**TINNE, Alexandrine Petronella Francina**, a Dutch traveller, born at the Hague, Oct. 17, 1835, murdered in Fezzan, Africa, Aug. 1, 1869. Her father was an English merchant, her mother the baroness Van Steengracht-Capellen of Holland. She was rich, travelled in Europe and the East, settled in 1861 in Cairo, and in 1862 set out from Khartoom with a steamboat, transport vessels, beasts of burden, and a large retinue, to visit the White Nile. Her state made the natives believe her the daughter of a sultan. In 1863 she explored the Bahr el-Ghazal, the W. arm of the White Nile, in company with Baron von Heuglin and Dr. Steudner, the latter of whom, together with Miss Tinne's mother, and many others, died from exposure. The expedition, which was absent 14 months, determined astronomically the position of Lake Meshera, one of the feeders of the Ghazal. The flora of the region has since been illustrated in Kotschy's *Planta Tinniana*, partly from her drawings and descriptions. In 1869 she set out from Tripoli for Bornoo, with 70 camels and 50 attendants, of whom the only Europeans were two Dutch sailors. From Moorzook she turned aside to visit the country of the Tuariks, and while on the way to Ghat was murdered by her attendants.

**TINOCERAS**, or *Titanotherium*, a fossil mammal of the order *dinocerata*, discovered by

Prof. O. C. Marsh in the eocene of Wyoming territory, in 1870. It was as large as an elephant, and had many characters of the proboscideans, with three separate pairs of horns, and large decurved canines like the walrus; it also had characters of both the perissodactyl and artiodactyl ungulates. These animals have been named *eobasilus* and *lozolophodon* by Prof. Ooep, and *uintatherium* by Prof. Leidy. ("American Naturalist," vol. vii., 1873.)

**TINTORETTO, Il**, an Italian painter, whose real name was **GIACOMO ROBUSTI**, born in Venice in 1512, died there in 1594. He was the son of a dyer, whence he received his popular name. He studied for a short time under Titian, and subsequently began a rigorous course of self-instruction, inscribing over his studio: *Il disegno di Michel Angelo e'l colorito di Tiziano* ("The drawing of Michel Angelo and the coloring of Titian"). He did not however content himself with following them, but aspired to become the founder of a school, which should supply whatever was deficient in their styles. He soon rose into great reputation among the Venetians, and in his best period his quickness of invention and the facility and rapidity of his execution were unequalled perhaps by any painter; but his impetuosity made his performances remarkably unequal. His portraits are his most uniformly excellent works, and his landscapes are distinguished for imaginative suggestiveness. But his reputation rests mainly upon his great historical pictures in Venice. His masterpieces are the two immense compositions representing St. Mark rescuing a tortured slave from the hands of the heathen, and the "Crucifixion," both painted in his best period. The doge's palace is rich in his works, and contains, among other remarkable pieces, a representation of paradise 84½ ft. long and 34 ft. high, painted, like almost everything he produced, in oil. In the latter part of his life he degenerated into a coarse style, of which his "Last Judgment" and "Worshipping of the Golden Calf," in the church of Sta. Maria dell' Orto, are examples. In the maturity of his powers he wrought so fast and at so low a price, that few of the contemporary painters of Venice could get employment. Many of his works were bestowed gratuitously upon convents, and for others he got barely enough to pay for the materials.

**TIOGA.** L. A S. county of New York, bordering on Pennsylvania, and intersected by the North branch of the Susquehanna river and by several railroads; area, 480 sq. m.; pop. in 1875, 31,744. The surface is very hilly and the soil generally fertile. The chief productions in 1870 were 103,955 bushels of wheat, 229,395 of Indian corn, 622,379 of oats, 167,674 of buckwheat, 398,770 of potatoes, 79,432 lbs. of wool, 1,907,767 of butter, and 65,078 tons of hay. There were 6,402 horses, 16,424 milch cows, 9,393 other cattle, 19,668 sheep, and 6,130 swine; 8 manufactories of agricultural implements, 3 of boots and shoes,

17 of carriages and wagons, 1 of machinery, 1 of pianos, 1 of printing paper, 11 flour mills, 12 tanneries, 35 saw mills, and 9 planing mills. Capital, Owego. **II.** A N. county of Pennsylvania, bordering on New York and drained by the Tioga river and its affluents; area, about 1,100 sq. m.; pop. in 1870, 35,097. The surface is hilly and heavily timbered, and the soil better adapted to grazing than tillage. Iron ore is found, and bituminous coal is abundant, of which large quantities are transported to Buffalo by the Corning, Cowanesque, and Antrim, and Tioga railroads. The chief productions in 1870 were 163,719 bushels of wheat, 236,818 of Indian corn, 564,684 of oats, 116,263 of buckwheat, 282,618 of potatoes, 89,788 lbs. of wool, 145,209 of maple sugar, 1,574,825 of butter, 65,889 of cheese, and 82,572 tons of hay. There were 6,148 horses, 16,017 milch cows, 15,149 other cattle, 32,729 sheep, and 8,331 swine; 3 manufactories of agricultural implements, 28 of carriages and wagons, 7 of cheese, 12 of furniture, 2 of glassware, 1 of woollens, 10 flour mills, 13 tanneries, and 46 saw mills. Capital, Wellsborough.

**TIPPAH**, a N. county of Mississippi, bordering on Tennessee, drained by the Hatchie and Tallahatchie rivers and Tippah creek; area, about 500 sq. m.; pop. in 1870, 20,727, of whom 5,091 were colored. The surface is undulating, and the soil fertile. The chief productions in 1870 were 37,429 bushels of wheat, 582,988 of Indian corn, 15,255 of oats, 43,125 of sweet potatoes, 15,457 lbs. of wool, 188,439 of butter, and 6,307 bales of cotton. There were 3,116 horses, 2,010 mules and asses, 18,761 cattle, 9,942 sheep, 32,629 swine, and 9 saw mills. Capital, Ripley.

**TIPPECANOE**, a river of Indiana, which rises in a lake of the same name in Kosciusko co., and flows generally S. W. into the Wabash river 9 m. above Lafayette, Tippecanoe co. Its length is about 200 m. It is famous for the battle fought on its banks, Nov. 7, 1811, in which the Americans under Gen. Harrison defeated the Indians under Tecumseh's brother.

**TIPPECANOE**, a W. county of Indiana, intersected by the Wabash river, drained by the Tippecanoe river and several creeks, and intersected by the Wabash and Erie canal and several railroads; area, 500 sq. m.; pop. in 1870, 33,515. The surface is generally level, and the soil a rich black loam. The chief productions in 1870 were 552,677 bushels of wheat, 909,367 of Indian corn, 177,578 of oats, 94,516 of potatoes, 54,286 lbs. of wool, 267,971 of butter, and 16,654 tons of hay. There were 9,095 horses, 5,836 milch cows, 12,608 other cattle, 16,310 sheep, and 27,293 swine; 4 manufactories of agricultural implements, 6 of boots and shoes, 25 of carriages and wagons, 5 of machinery, 1 of paper, 1 of vegetable oil, 3 of woollens, 14 flour mills, 3 breweries, 1 distillery, 1 planing mill, 6 saw mills, and 1 beef-packing and 3 pork-packing establishments. Capital, Lafayette.

**TIPPERARY**, a S. county of Ireland, in the province of Munster, bordering on the counties of Galway, King's, Queen's, Kilkenny, Waterford, Cork, Limerick, and Clare; area, 1,639 sq. m.; pop. in 1871, 216,210. In the N. part a range of mountains extends completely across from the Shannon to King's county, and there are several groups in other parts of the county, the highest of which does not exceed 2,500 ft. above the sea. The principal rivers are the Shannon, which flows along the W. boundary, and the Suir, which intersects it and partly bounds it on the south. A portion of Lough Derg is in Tipperary. The soil of the level country is a rich loam of great fertility. Butter is largely exported. Coal, copper, lead, and slates are found. It is divided into the North and South ridings, of which the chief towns are Nenagh and Clonmel. The town of Tipperary, on the Arra, an affluent of the Suir, has a large trade in agricultural produce; pop. in 1871, 5,638. Carrick-on-Suir and Cashel are also in the county.

**TIPPOO SULTAN**, or **Tippoo Sahib**, the last independent sovereign of Mysore, born in 1749, killed at Seringapatam, May 4, 1799. He was the son of Hyder Ali, and was first known by the appellation of Feth Ali Khan. He distinguished himself in the war against the English, and succeeded his father, Dec. 7, 1782. He at once gave a new impulse to the war, took Bednore and other cities, and concluded a peace, March 11, 1784, on advantageous terms. He then assumed the titles of sultan and padishah, and subdued the Nairs of Malabar, carrying off from that province, it is said, 70,000 Christians, and forcing 100,000 Hindoos to become Mohammedans. Under a flimsy pretext, in December, 1789, he broke the treaty with the English by invading the territory of their ally, the rajah of Travancore. The English in turn invaded Mysore, took several of his strongholds, were joined by the Mahrattas and the subahdar of the Decan, and, under Cornwallis and Abercromby, besieged him in Seringapatam, his capital. In March, 1792, Tippoo was forced to conclude peace, agreeing to pay within a year 33,000,000 rupees, to give up to the allies nearly half of his dominions, and to deliver two of his sons as hostages. The earl of Mornington (afterward Marquis Wellesley), then governor general of India, subsequently discovered that he was engaged in intrigues with the French and making preparations for war, and in February, 1799, on his refusal to desist from arming his subjects, gave orders for the invasion of Mysore. Gens. Stuart and Harris defeated the Mysoreans in two encounters, at Sidasir and Malaveli; and the sultan himself was obliged to take refuge in Seringapatam, at the storming of which by Gen. Baird he was killed.

**TIPTON**. **I.** A W. county of Tennessee, bordering on the Mississippi river, and bounded N. by the Hatchie; area, 370 sq. m.; pop. in 1870, 14,884, of whom 6,891 were colored. It

has a level surface and fertile soil. Its S. E. corner is intersected by the Louisville and Nashville and Great Southern railroad. The chief productions in 1870 were 30,579 bushels of wheat, 446,771 of Indian corn, 18,681 of oats, 12,104 of Irish and 18,880 of sweet potatoes, 74,777 lbs. of butter, and 10,052 bales of cotton. There were 1,879 horses, 1,851 mules and asses, 2,784 milch cows, 4,315 other cattle, 4,675 sheep, and 20,240 swine. Capital, Covington. **IL** A central county of Indiana, drained by Cicero creek and other streams; area, 280 sq. m.; pop. in 1870, 11,958. The surface is level and the soil fertile. It is intersected by the Indianapolis, Peru, and Chicago, and the Pittsburgh, Cincinnati, and St. Louis railroads. The chief productions in 1870 were 149,822 bushels of wheat, 357,835 of Indian corn, 21,487 of oats, 25,418 of potatoes, 30,648 lbs. of wool, 179,905 of butter, and 4,892 tons of hay. There were 2,967 horses, 2,059 milch cows, 3,691 other cattle, 10,762 sheep, and 11,835 swine; 1 flour mill, 14 saw mills, and 1 woollen factory. Capital, Tipton.

**TIRABOSCHI, Girolamo**, an Italian author, born in Bergamo, Dec. 28, 1731, died in Modena, June 8, 1794. He was educated in the Jesuit college of Monza, became a Jesuit, and about 1766 was appointed professor of rhetoric in the university of Milan. In 1770 he was made librarian of the duke of Modena. His *Storia della letteratura italiana* (13 vols., Modena, 1772-'83; best ed., 16 vols., Milan, 1822-'6) extends from the earliest times to the end of the 17th century. Tiraboschi was also the author of many other literary, historical, and biographical works.

**TIRESIAS**, a Greek soothsayer, born in Thebes, the son of Eueres and Chariclo, and fabled to have lived through nine generations of men, but blind from his seventh year. His loss of sight was ascribed by one account to the fact that he disclosed to mortals what they should not know; by another, to his having seen Minerva bathing, who blinded him by sprinkling water upon him. In compensation, she gave him a staff by which he could guide his steps as safely as by sight, and ability to understand the voices of birds and thus know futurity. His oracle was at Orchomenus.

**TIRYNS**, one of the oldest cities of Greece, in Argolis, the site of which is 2 m. N. of Nauplia. The name is supposed to be an ancient form of *ῥύππις*, a tower or castle. It was founded by Prætus, and said to have been surrounded with walls by the Cyclops. These walls are the finest existing specimens of the military architecture of the heroic age of Greece. The ruins at present occupy the lowest hill of several which rise out of the plain, and the entire circuit of the walls enclosing the citadel is still preserved to some extent, being from 20 to 25 ft. wide and 350 yards in circumference. On the E. side of the hill are two towers, and the S. E. part of the wall has a remarkable covered gallery 36 ft.

long and 5 ft. broad. In 468 B. C. Tiryns was entirely destroyed by the Argives.

**TISCHEIN, Johann Heinrich Wilhelm**, a German painter, born at Haina, Feb. 15, 1751, died at Eutin, Oldenburg, July 26, 1829. He was one of a family of painters, resided several years in Rome, and was director of the academy of Naples from 1790 to 1799, when he returned to Germany. He excelled in drawing animals, but is chiefly known by illustrated works, including *Têtes de différents animaux dessinées d'après nature* (2 vols. fol., Naples, 1796); "A Collection of Ancient Vases, &c., in the possession of Sir William Hamilton" (4 vols. fol., Naples, 1790-1804, with 214 plates, engraved from Tischbein's designs); and *Homer nach Antiken gezeichnet*, with explanations by Heyne (fol., Göttingen, 1801-'4).

**TISCHENDORF, Lohgott** (Latinized *Enotherus*) **Friedrich Constantia von**, a German Biblical palæographer, born at Lengenfeld in the Voigtland, Saxony, Jan. 18, 1815, died in Leipsic, Dec. 7, 1874. From 1834 to 1838 he studied philology and theology at Leipsic, where he published two prize essays: *Doctrina Pauli Apostoli de Vi Mortis Christi satisfactoria* (1837), and *Disputatio de Christo Pans Vita* (1839), and a volume of poems entitled *Mai-knospen* (1838). He was for a year and a half a private teacher in the neighborhood of Leipsic, at which time he wrote *Der junge Mystiker*, a novel, published under the pseudonyme of Dr. Fritz. Devoting himself thereafter to textual criticism, he returned to Leipsic, wrote an essay on Matt. xix. 16, and a severe criticism of the published texts of the New Testament, with special reference to the edition of Scholz, and in 1841 published his own edition of the Greek Testament, embodying the various readings of the *textus receptus*. The years 1841-'4 were in great part spent by him in visiting the various libraries of Europe for the purpose of collating, copying, and publishing the most important New Testament manuscripts in their possession. In 1844, 1853, and 1859 he made journeys through the East, visiting numerous libraries and monasteries of Asia Minor, Palestine, the Sinaitic peninsula, and Egypt. He published accounts of two of these journeys, *Reise in den Orient* (Leipsic, 1845-'6), and *Aus dem heiligen Lande* (1862). With the exception of the last journey, which he made under the auspices of the emperor of Russia, he received pecuniary assistance for his travels from the Saxon government. In 1842, while at Paris, he prepared an edition of the New Testament intended for the use of Catholics, giving the Latin Vulgate and a Greek text, rendered as far as possible conformable to it, in parallel columns. He published also in the same year a Greek text differing very little from his earlier Leipsic edition. In 1843 appeared the New Testament portion of his publication of the Ephraem palimpsest of the 5th century. Two years later, when the remainder of this edition was

published, he was made professor extraordinary in Leipsic. The principal result of his first oriental journey, in 1844, was the discovery of 43 leaves of a Septuagint manuscript of the 4th century, then called *Codex Fredericus Augustanus*, but subsequently discovered to form part of the *Codex Sinaiticus*. The fragment was published in 1846 in lithographed facsimile. The same year also appeared the *Monumenta Sacra Inedita*, containing the manuscripts F, L, N, W, Y, and Θ of the Gospels, and B of the Apocalypse. In 1847 he issued a portion of a manuscript of the old Latin version of the Gospels, and the *Wiener Jahrbücher* brought out serially during the following years his edition of the old Latin *Codex Bobbiensis*. In 1849 Tischendorf published a second edition of his Leipsic Greek Testament of 1841, fully revised according to all the material so far collected, and in 1850 the same text with marginal readings of the *textus receptus*, a correct reprint of the Vatican edition of the Septuagint with marginal readings of the Ephraem and Alexandrine manuscripts, and the New Testament according to the *Codex Amiatinus*, probably the oldest manuscript of the Latin Vulgate. In 1851 he obtained the prize offered by the society of the Hague for the defence of the Christian religion, with a dissertation entitled *De Evangeliorum Apocryphorum Origine et Usu*, and published his *Acta Apostolorum Apocrypha*, and a *Synopsis Evangelica*, a Greek harmony with the principal readings, and advocating the tripaschal theory. In 1852 he published a Græco-Latin manuscript of the Pauline epistles of the 6th century; in 1853 the *Evangelia Apocrypha*; and in 1854 a *Novum Testamentum Triglossum*, being the Greek text of 1849 revised, a critical edition of the Latin Vulgate, and Luther's German translation substantially after the edition of 1545, but corrected from other editions published in Luther's lifetime. The prolegomena and various addenda accompanying this work render it one of Tischendorf's most valuable publications. In his *Anecdota Sacra et Profana* (1855) he gives an account of the manner in which he secured the numerous manuscripts, describing also their general character. The larger part of the manuscripts which he obtained were deposited in the library of the university of Leipsic, while others were sold to the British museum and the Bodleian library. In 1855 he began a new collection of *Monumenta Sacra Inedita*, in nine volumes, of which he completed seven, and a seventh and larger critical edition of his Greek Testament of 1849 (2 vols., 1859). In 1856 he added to his Septuagint of 1850 the *Codex Chisianus* version of the book of Daniel. In 1859 he was made ordinary professor of theology and Biblical palæography, which chair was founded expressly for him. His third oriental journey, made in this year, resulted in the discovery at the convent of St. Catharine, near Mt. Sinai, of the famous *Codex Sinaiticus*.

(See MANUSCRIPT.) He gave the first account of it in his *Notitiæ Codicis Sinaitici* (1860), and a more popular one in a pamphlet entitled *Die Sinaitibibel, ihre Entdeckung, Herausgabe und Erwerbung* (1871). The Sinaitic manuscript was printed in facsimile type (4 vols. fol., St. Petersburg, 1862). Tischendorf received from the Russian government 100 copies, with permission to sell them at about \$200 each. In 1863 was published an abridged edition of it, containing only the New Testament, Barnabas, and a portion of the Shepherd of Hermas, and giving the manuscript line for line, but in ordinary type. Tischendorf prepared in 1864 another edition of his *Synopsis Evangelica*, in which he adopted a large number of readings from the *Codex Sinaiticus*. His *Novum Testamentum Græce ex Sinaitico Codice* (1865) presented also the variations of the *textus receptus* and Vatican manuscript, and has a more elaborate introduction than the edition of 1868, for which however it does not form a complete substitute as a manual for critical purposes. In the same year appeared his *Wann wurden unsere Evangelien verfasst?* which met with an enormous sale, though in many respects sharply criticised by eminent Biblical palæographers. In 1866 Tischendorf published *Apocalypses Apocrypha*, and added to a new edition of the treatise on the date of the Gospels a severe criticism of the arguments which had been brought out against his theories; and in this form the pamphlet was rapidly translated into nearly all modern languages. In *Appendix Codicum celeberrimorum, Sinaitici, Vaticani, Alexandrini* (1867), giving fragments of the *Codex Sinaiticus* found in the binding of some manuscripts, and an edition of the Alexandrine epistles of Clement of Rome, he expressed his opinion that one of the scribes of the Sinaitic manuscript wrote also the New Testament of the Vatican manuscript. The *Novum Testamentum Vaticanum*, a corrected edition of the one by Cardinal Mai, published by Tischendorf about the same time, was two years later supplemented by him with an *Appendix Novi Testamenti Vaticani*, which furnished also the Vatican text of the Apocalypse and corrected the errors of the main edition. His subsequent publications are all signed Constantin von Tischendorf, instead of Constantin Tischendorf, Alexander II. having conferred upon him the rank of a hereditary noble. With the assistance of B. Harris Cowper, he published in 1869, as the thousandth volume of the Tauchnitz collection of British authors, the authorized English version of the New Testament, with readings from the Sinaitic, Vatican, and Alexandrine manuscripts. In 1870 he brought out a corrected edition of the *Novum Testamentum Græce ex Sinaitico Codice* of 1865, and published a pamphlet, entitled *Responsa ad Calumnias Romanas*, in defence of his *Novum Testamentum Vaticanum*. The next year appeared a third edition of the *Synopsis Evangelica*, in

which several of the readings adopted for the second edition are omitted. In 1872 he completed the important eighth larger critical edition of his Greek Testament, which for fulness and accuracy excels all that preceded it. He published also the first of the two parts of an abridged edition of this valuable work; the second part was not completed at the time of his death. The minor editions of Tauchnitz and Brockhaus (1873) are corrected by this critical edition. In 1873 Tischendorf completed Theodor Heyse's edition of the Latin Vulgate, and in 1874 he published in conjunction with Baer and Delitzsch a *Liber Psalmorum Hebraicus et Latinus ab Hieronymo ex Hebraeo conversus*. Shortly before his death appeared his 22d edition of the New Testament.

**TISHOMINGO**, a N. E. county of Mississippi, bordering on Tennessee and Alabama, bounded N. E. by the Tennessee river, and drained by affluents of the Tennessee and Tombigbee rivers; area, about 550 sq. m.; pop. in 1870, 7,850, of whom 741 were colored. The surface is hilly and the soil fertile. It is traversed by the Memphis and Charleston railroad. The chief productions in 1870 were 4,819 bushels of wheat, 188,886 of Indian corn, 18,578 of sweet potatoes, 1,897 bales of cotton, 3,999 lbs. of tobacco, 6,957 of wool, and 94,624 of butter. There were 1,117 horses, 2,091 milch cows, 7,140 other cattle, 4,547 sheep, and 9,188 swine; 1 cotton factory, 2 planing mills, and 5 saw mills. Capital, Iuka.

**TISSAPHERNES**, a Persian general, assassinated in Colossæ, Phrygia, in 395 B. C. In 414 Darius Nothus appointed him satrap of Lower Asia, S. of the Adramyttian bay, in place of Pisuthnes, then in revolt. He was ordered by the king to collect from the Hellenic cities within his jurisdiction the tributes in arrears for half a century, and also to slay or imprison Amorges, the son of Pisuthnes, who had rebelled and made an alliance with the Athenians. Tissaphernes obtained the aid of the Spartans through the influence of Alcibiades, who desired to support the Chians in their revolt against the Athenians. Throughout the ensuing contest, comprising the closing scenes of the Peloponnesian war, Tissaphernes acted treacherously to his allies. (See *ALCIBIADES*, and *GREECE*, vol. viii., p. 194.) In 407 Cyrus the Younger was appointed viceroy of the maritime region of Asia Minor. Hostility soon sprang up between him and Tissaphernes, who accused him, after the death of Darius, of aspiring to the throne of his brother Artaxerxes II. Tissaphernes, being one of the four generals who commanded the Persian army at Cunaxa, gained possession of the persons of the five generals commanding the Greek mercenaries of Cyrus, and put four of them to death. During the famous retreat of the 10,000 under Xenophon he continually harassed them as far as the Carduchian mountains. For his services he was made governor of the provinces formerly ruled by Cyrus, and as such he

carried on war with the Spartans. Complaints against him constantly arrived at the Persian court, and Tithraustes was sent to put him to death. Tissaphernes was surprised in the bath and slain, and his head sent to Artaxerxes.

**TISSOT**, *Simon André*, a Swiss physician, born at Grancy, in the canton of Vaud, March 20, 1728, died in Lausanne, June 15, 1797. He studied at Geneva and Montpellier, settled at Lausanne about 1750, acquired great eminence as a practitioner, and became professor in the university. In 1780 he accepted the professorship of clinical medicine at Pavia, and in 1788 returned to Switzerland. His most important works are: *Historia Epidemiarum Lausaniensis Anni 1755* (Lausanne, 1758; French, 1759); *L'Onanisme* (Latin and French, 1760; latest ed., revised and enlarged by M. A. Petit, Lyons, 1856); *Avis au peuple sur la santé* (1761; 12th ed., 1799); and *De la santé des gens de lettres, suivi de l'essai sur maladies des gens du monde* (1768-'70; new ed., revised by Bertrand de Saint-Germain, Paris, 1859). His complete works have been edited by Hallé, with a biography and annotations (11 vols., Paris, 1809-'13).

**TITANIUM**, a metal first detected in 1789 by Gregor in titanite iron, and found by Klaproth in 1794 in rutile, and named by him from the Titans. Dr. Wollaston in 1822 recognized it in the form of minute copper-colored cubical crystals found in the slags of the iron-smelting furnaces at Merthyr Tydfil in South Wales, and these, often met with since that time in iron slags, were formerly regarded as pure titanium, but are now understood to be compounds of the metal with nitrogen and cyanogen. Berzelius was the first to separate this metal in a state of purity. He decomposed a mixture of the fluorides of titanium and potassium by means of metallic potassium, and obtained the metal in a grayish powder. M. Sainte-Claire Deville obtained it in forms resembling specular iron ore, crystallized in prisms with a square base. Its chemical equivalent is 50; symbol, Ti. Three oxides of the metal are known,  $TiO$ ,  $Ti_2O_3$ , and  $TiO_2$ ; the last of which, titanic anhydride, is the only one of interest. It occurs as a mineral in three forms: as rutile and anatase, which both crystallize in the dimetric system, though with different angles, and as brookite, crystallizing in the trimetric system. Rutile is generally a reddish brown mineral, sometimes yellowish or black, harder than feldspar, and of specific gravity 4.18 to 4.26. It occurs in many parts of Europe and America, the richest localities in the United States being in Chester and Lancaster cos., Pa. In Vermont and New Hampshire, as also in Brazil and Switzerland, it is found in long needles enclosed in masses of transparent quartz, making very curious and beautiful specimens, which are often used in jewelry. Anatase and brookite are comparatively rare minerals. In combination with oxide of iron, titanic acid forms the compound ilmenite or

titaniferous iron. (See IRON ORES.) This is met with in large masses in Maryland, northern New York, and Canada. At Bay St. Paul on the St. Lawrence are beds of it, from 100 to 800 ft. long and 90 ft. thick, the ore, according to T. Sterry Hunt, containing 48·60 per cent. of titanio acid combined with 37·06 of protoxide of iron, 10·42 of peroxide of iron, and 3·60 of magnesia.—The only useful application of titanium is to furnish a yellow color in porcelain painting, and to give the proper tint to artificial teeth. The American supply for these purposes is derived from Pennsylvania. Tessie du Motay employs the strong attraction of titanium for nitrogen to produce ammonia directly from the atmosphere. If a mixture of titanio anhydride and charcoal, both in a minute state of division, be heated to whiteness and submitted to a current of air, nitrogen is rapidly absorbed, and carbonic oxide escapes. By passing steam over the copper-colored crystals which result, ammonia is copiously evolved, and it is claimed that the operation may be made continuous.

**TITANS**, in Greek mythology, the sons and daughters of Uranus (Cælus) and Gæa (Terra). They were Oceanus, Cæus, Crius, Hyperion, Japetus, Cronus, Theia, Rhea, Themis, Mnemosyne, Phœbe, and Tethys. According to the most generally received account, Uranus feared his offspring, and as fast as they were born threw them into Tartarus. Gæa endeavored to persuade them to free her and themselves from this oppressive treatment. Cronus, armed with a sickle made by his mother, unmanned his father, and thus secured liberty and power for himself and his brothers. Marrying his sister Rhea, he begot three sons and three daughters, but, having been told that he would be destroyed by one of his own children, swallowed them as soon as they were born. Rhea concealed Zeus (Jupiter), the youngest, in a cave in Crete, giving to Cronus instead a stone wrapped in swaddling clothes. When Zeus had grown up, he was enabled by stratagem to make his father vomit up the stone and the five children he had swallowed. Supplied by the Cyclops with thunder and lightning, and aided by the Centimani, Zeus carried on a war against the Titans for ten years, and at length triumphed. The Titans, with the exception of Oceanus, were confined for ever in a subterranean dungeon, where they were guarded by the Centimani. The name of Titans was also given to their descendants.

**TITE**, Sir **William**, an English architect, born in London in 1802, died in Torquay, April 20, 1878. He studied under Laing, and early superintended the restoration of the church of St. Dunstan-in-the-East. He built the famous gothic Irvingite church in London, and several fine railway stations in France and England. His most celebrated work is the royal exchange, London. He was president of the institute of British architects from 1862 to 1864, a member of parliament for Bath from 1855 till his

death, and was knighted in 1869. He was a high financial authority, and presided for some time over the London and Westminster bank and the bank of Egypt.

**TITHES** (Ang. Sax. *teotha*, a tenth), a tax of one tenth of the increase of crops, stock, and avails of personal industry, formerly and still in some countries levied for the support of the officers of religion, religious worship, or the assistance of the poor. This tax seems to have been of patriarchal origin (Gen. xiv. 20), and existed in many of the nations of antiquity. Under the Jewish theocracy the tenth part of the increase of the property of the Jews was accorded to the Levites, as a substitute for the landed inheritance which they forfeited by their consecration to the temple worship, and also as a compensation for their services. Other tithes were also prescribed for the sacrifices of the temple, and at particular periods for the poor. The early Christian church adopted voluntarily the custom of consecrating to religious purposes a tenth of the income, it being admitted that first fruits and tithes were not of divine precept in the new law, but held that the obligation of supporting the ministers of religion is of divine origin. It does not appear that the payment of tithes was ever enjoined as obligatory by the Greek or other eastern churches. The first known canonical enactment made for that purpose in the Latin church was a statute of the second council of Tours in 567, and this collection was enforced under pain of excommunication by the second council of Mâcon in 585. In France, Charlemagne established them by decree in the 8th century. In England the first law in relation to them is believed to have been that of Offa, king of Mercia, who brought the civil power to the aid of the clergy in collecting their tithes. This was subsequently extended over the whole of England by Ethelwulf. In the 9th century they were also made obligatory in Scotland, and not long after in Ireland. At first they were paid to whatever church the payer chose, but the decretal of Pope Innocent III. directed their payment to the parsons of the respective parishes in which they arose. By the ecclesiastical law tithes were divided into three kinds: "prædial," or such as arose immediately from the ground, like grain of all kinds, fruits, herbs, grasses, hops, wood, &c.; "mixed," natural products, but nurtured, and preserved in part by the care of man, such as wool, milk, pigs, butter, cheese, &c.; and "personal," as of manual occupations, trades, fisheries, &c. The first two kinds were payable in gross, but of the third class only the tenth part of the clear gains and profits was due. In France, Charlemagne divided the tithes into four parts, one to maintain the edifice of the church, another to support the poor, a third to maintain the bishop, and a fourth the parochial clergy. By the original law in England, all lands except those of the crown and of the church itself were tithable; but at the refor-

mation many of the forfeited church lands when sold were specially exempted, and some were also exempted by composition and some by prescription. These partial exemptions only made the burden more galling to those who were compelled to pay; and as the tithes were a tax for the support of the clergy of the established church, it was particularly annoying to dissenters, and has been for two centuries a constant subject of complaint. Until the reign of William IV. the payment of tithes might be exacted in kind, but by the act of 6 and 7 William IV., c. 71, and subsequent acts, tithes have been converted into a rent charge payable in money, but varying annually according to the average price of corn for the preceding seven years. In Ireland they had been compounded at three fourths their former estimated value previous to the disestablishment act of 1869, which abolished tithes, and created a common fund for the support of the Protestant Episcopal church and clergy. In France tithes were abolished at the revolution, and this example was followed afterward by the other continental states. In the Canadian province of Quebec tithes are still collected by the Roman Catholic clergy, in virtue of the old French law still in force there. In the United States tithes are only exacted by the Mormon hierarchy, and among them the system is modelled on that of the Jewish theocracy.

**TITIAN** (TIZIANO VECELLIO), an Italian painter, born near Pieve di Cadore, Friuli, in 1477, died in Venice, Aug. 27, 1576. He is said to have made his first attempts at coloring in his early childhood with juices expressed from flowers. In his ninth year he was placed under Sebastiano Zuccati, a Venetian painter and worker in mosaic, and subsequently studied under Bellini. He also came probably under the influence of Albert Dürer, who visited Venice in 1494 and again in 1507, but was indebted chiefly to his intimate friend and fellow student Giorgione for the ideas of art and color which long governed him. At Giorgione's death in 1511 the styles of the two artists were so similar that it was difficult to distinguish their productions, and Titian readily completed the unfinished works of his friend. Perceiving that breadth of form produced breadth of color, he endeavored to see nature in a more ample light, and, instead of copying or imitating her tones, to generalize and elevate them in accordance with his original conceptions. The result was a free and serene beauty of form and expression, and a representation of life realizing what Kugler calls "the glorification of earthly existence, and the liberation of art from the bonds of ecclesiastical dogmas." Left at the age of 34 without a rival, Titian entered upon a career which for the uniform excellence of its productions, for celebrity and duration, has perhaps no parallel in the history of painting. Commissions from the wealthy Venetian nobility afforded him abundant employment. In

1514 he visited the court of Duke Alfonso I. of Ferrara, for whom he painted the "Arrival of Bacchus in the Island of Naxos" and "A Sacrifice to the Goddess of Fertility," which are at Madrid, and the "Bacchus and Ariadne," in the British national gallery, which presents an epitome of all the characteristic beauties of Titian in composition, color, and form. At Ferrara he also painted portraits of Lucrezia Borgia and of Ariosto. He was again at Venice from 1516 to 1580, when he went to Bologna to paint the portraits of the emperor Charles V. and Pope Clement VII., and to Mantua, where he executed for the duke a series of the twelve Cæsars. At 65 he retained the vigor and freshness of youth, while the magic charm of his color and the cheerful serenity of his style seemed to mellow with time. In 1543-'5 he revisited Bologna and Ferrara, and painted the emperor Charles V. for the third or fourth time, and Pope Paul III. After passing some time in the employment of the duke of Urbino, he went to Rome, where he produced a masterpiece in his picture of the old pope with his grandsons, Cardinal Farnese and Duke Ottavio Farnese. While engaged upon a picture of Jupiter and Danaë, he was visited by Michel Angelo, who, after expressing admiration for his coloring, observed that if he had been early grounded in the principles of drawing, he would rank as the first painter in the world. In 1548 he was summoned by Charles V. to Augsburg, and received from him the title of count palatine of the empire and a pension. After the abdication of Charles he continued in great favor with his son Philip II. of Spain, for whom he painted important works; but his pension was thenceforth constantly in arrears, and he was frequently obliged to petition the Spanish officials for the sums due him for pictures. The remainder of Titian's life was passed principally in Venice. His "Martyrdom of St. Lawrence," in the Jesuits' church in Venice, painted when he was 81, is one of his largest and grandest compositions; and at least one of his celebrated Magdalens, that in the Escorial, was executed even later. At 90 years of age sorrow rather than time began to affect him, and, notwithstanding he clung resolutely to his art for consolation, the vigor and beauty of his style became impaired. In his 97th year he received Henry III. of France, who passed through Venice on his way from Poland, with magnificent hospitality; and two years later, while yet occupied with his art, he fell a victim to the plague. His latest work was a dead Christ with the Virgin and attendant saints, now in the academy of Venice. By a special exception in his favor he was buried in the church of Santa Maria de' Frari.—The works of Titian comprise sacred and profane history, mythological subjects, portraits, and landscapes, the last named being generally treated in connection with other subjects, though not always in subordination to them. Many of the pictures pass-

ing under his name are not well authenticated. He is seen to the best advantage in Venice. Of his early pictures, which reflect the style of the Bellini modified by the peculiar ideas derived from Giorgione, the most noticeable are the "Visit of Mary to Elizabeth," in the academy at Venice; the *Vierge au Lapin*, in the Louvre; the "Christ with the Tribute Money" (engraved by Gustav Eilers, Berlin, 1875), at Dresden; and particularly the "Resurrection," painted in five compartments, in the church of San Nazaro, at Brescia. The more developed period which succeeded the death of Giorgione comprises nearly all the pictures by which he is now known. The first in celebrity of these perhaps is the "St. Peter Martyr," in the church of Santi Giovanni e Paolo in Venice, which ranks with the "Martyrdom of St. Lawrence" among the painter's masterpieces. The academy of Venice contains his "Assumption" and "Presentation of the Virgin," and the Manfrini palace in the same city the "Entombment of Christ." In addition to these may be mentioned the "Last Supper," in the Escorial, upon which he labored seven years; a "Virgin and Child with Saints," in the Uffizi gallery; the "St. Sebastian," in the Vatican; the "Christ crowned with Thorns," in the Louvre; various well known Magdalens in Rome, Florence, the Escorial, and elsewhere; and numerous Madonnas, Holy Families, and similar pieces scattered over Europe. Upon subjects taken from allegory and secular history he executed several important pictures, including the "Victory of the Venetians over the Janizaries," for the doge's palace, which were destroyed by fire. As a colorist merely Titian developed the resources of his art with most success in naked female figures. The most familiar examples are the several Venuses in the galleries of Florence and Dresden; the Danaës at Naples and Vienna; the Flora in the Uffizi gallery; "Diana and her Nymphs" and "Venus rising from the Sea," in the Stafford gallery; "Venus and Adonis" (a duplicate), in the British national gallery; and the so-called *Venus del Pardo* in the Louvre. As a portrait painter he is unrivalled; and Fuseli says that landscape dates its origin from him. —See Northcote's "Life of Titian" (2 vols., London, 1830), and that by Crowe and Cavalcaselle (1875).

**TITICACA**, a lake of South America, partly in Bolivia and partly in Peru, in the valley of the Desaguadero, more than 12,000 ft. above the sea. From recent but incomplete surveys it is estimated to be about 100 m. long, with an average breadth of 35 m. Scattered over its surface are many small islands containing the remarkable ruins called Tiaguanaco. These indicate a higher order of art than any existing at the time of the Spanish conquest, and a higher civilization than the aboriginal monuments at Palenque. According to the early Spanish chroniclers, the Peruvians had but the vaguest traditions of their origin, and there

are striking evidences of their great antiquity. Some of the structures, on a pyramidal plan, appear to have covered several acres, but the most remarkable features still remaining are monolithic doorways, pillars, and statues elaborately sculptured in a style found nowhere else. One of these doorways is 10 ft. high and 18 ft. broad, with an opening 6 ft. 4 in. by 3 ft. 2 in., the whole cut from a single stone. Its E. front has a cornice, in the middle of which is a human figure crowned with rays, interspersed with serpents with crested heads. On each side are three rows of human and other figures, apparently symbolic. The statues are much broken, but their original dimensions were colossal. The whole neighborhood is strewn with vast blocks of stone elaborately wrought. The principal ruins are on an island bearing the same name as the lake, close to the S. W. shore. On some of the islands are other monuments of great extent, but of true Peruvian type, apparently the remains of temples destroyed on the arrival of the Spaniards. (See AYMARAS.) Since 1871 two small steamers, carried in pieces across the Andes, have been launched on the lake. A railroad extending about 220 m., across the Andes from Arequipa to Puno on the W. shore of Lake Titicaca, was begun in 1870 and completed Jan. 1, 1874, at a cost of \$32,000,000. It opens to market the wealth of the lake shores, alpaca wool, cinchona, chocolate, coffee, and other products, and the silver, copper, and timber of the surrounding mountains.

**TITJENS**, or **Titicus**, **Theres**, a German vocalist of Hungarian extraction, born in Hamburg in 1834. She appeared upon the operatic stage in Hamburg at the age of 15, was engaged for the opera in Frankfort, and subsequently entered into an engagement for three years with the director of the imperial theatre at Vienna, during which she established her reputation as a representative of the greater rôles of the lyric stage, such as those of Leonora in *Fidelio*, Valentina in *Les Huguenots*, and Donna Anna in *Don Giovanni*. At the close of this engagement she transferred her services to Her Majesty's theatre, London, and since that time has lived mostly in England, taking part in the great musical festivals in that country, and being equally distinguished as an operatic and oratorio singer. In 1875 she visited America.

**TITLARK**, the popular name of the small denti-rostral birds of the family *motacillidae*, subfamily *anthinae*, and genus *anthus* (Bechst.). They resemble the larks in their markings and in the long hind claw, and the wagtails in their movements and habits on the ground, and evidently are intermediate between these subfamilies. In this genus the bill is rather straight and slender, with the tip notched; wings very long, the first three quills equal and longest, and the tertials nearly as long as the primaries; tail moderate and slightly notched; tarsi and toes long and slender, the

hind toe long with a very long sharp claw. The species are numerous, inhabiting most parts of the world and in every variety of region, some being migratory, others perma-

American Titlark (*Anthus Ludovicianus*).

nent residents. The nest is made upon the ground, of dry grass and stalks, lined with finer plants and hair; the eggs are four to six. The American titlark (*A. Ludovicianus*, Licht.) is  $6\frac{1}{2}$  in. long and 11 in. in alar extent; olive brown above, each feather darkest in the middle; beneath yellowish brown, the sides of the neck spotted longitudinally with dark brown; around eyes and superciliary stripe yellowish; central tail feathers like back, the others blackish brown, the external one mostly white and a white spot at the end of the second; primaries edged with whitish, and the other quills with pale brownish; bill and feet black. It is very generally distributed over North America, extending to the Pacific and to Greenland, and is accidental in Europe. The flight is exceedingly easy and graceful; it occurs in flocks of tens or hundreds running fast on the ground. It is found in the fields, on the prairies, along rivers, and on the sea shore; the notes are clear and sharp tweets, the last much prolonged; it breeds as far N. as Labrador, both sexes incubating, and sitting so closely as almost to allow themselves to be trodden upon before flying; the eggs are six,  $\frac{3}{4}$  by  $\frac{1}{4}$  in., reddish brown, with darker dots and lines at the larger end. The Missouri titlark (*neocorys Spraguei*, Selater),  $5\frac{1}{2}$  in. long and  $9\frac{1}{2}$  in. in extent of wings, in song and habits comes the nearest of American birds to the European skylark.—Among the European species, the most extensively distributed is the meadow titlark or pipit (*A. pratensis*, Bechst.), also called titling; it is  $6\frac{1}{2}$  in. long and  $9\frac{1}{2}$  in. in alar extent, olivaceous above, spotted with dusky; brownish white below, tinged anteriorly with red; neck, sides, and fore part of breast with oblong brownish black spots. It is of slender and elegant form, generally distributed over Europe, a permanent resident in Great Britain, and most abundant in meadows;

it sings from the middle of April to the end of July, and rears two broods in a season; its notes are remarkably fine, the bird uttering them perched, seated, or flying, in the last case beginning at a considerable height, hovering a little while, and descending warbling to the ground. It is in the nest of this species that the cuckoo generally places its eggs.

**TITMOUSE**, the popular name of the *parina*, a subfamily of the warblers, found in all parts of the world except South America. The bill is short, strong, rather conical and straight, with the tip entire; nostrils generally concealed by the frontal plumes; wings moderate and pointed, with the first three quills graduated; tail more or less long, rounded and even; tarsi long, slender, and scaled in front; inner toe shortest; claws strong and curved.—In the typical genus *parus* (Linn.) the bill is somewhat curved, not very stout; the head is not crested; the fourth and fifth quills are equal and longest; the crown and throat generally black. There are more than 50 species described in North America, Europe, Asia, and Africa, small, sprightly, and bold birds, and many of them with beautiful colors. They sometimes do considerable damage in orchards by picking open the buds in search of insects. The nests are made in the forks of bushes and trees, of moss, grasses, and wool, lined with hair and feathers; many of the best known species deposit their eggs in holes of decayed trees, left by the woodpeckers or made by themselves; the eggs are six to twelve.—The largest of the well known American species is the tufted titmouse (*lophophanes bicolor*, Bonap.),  $6\frac{1}{2}$  in. long and about 10 in. in alar extent; the crown has a conspicuous crest, the bill is conical with the upper and lower outlines convex, wings graduated with the first quill very short, and the tail moderately long and rounded. The color above is ashy black; frontal band black; under parts uniform whitish, sides brownish chestnut; sides of head nearly white, and bill black. It is found throughout eastern

Tufted Titmouse (*Lophophanes bicolor*).

North America to the Missouri, appearing in the middle states about May 1, in the summer inhabiting the forests, in flocks or families of eight or ten, in company with the nuthatch

and downy woodpecker; the note is a kind of pleasing whistle; the eggs are six or eight, white with a few red spots at the larger end, and are laid in holes of decayed trees.—In the genus *parus* (Linn.) belongs the black-capped titmouse or chickadee (*P. atricapillus*, Linn.). (See BLACKCAP.) The largest of the European species is the great titmouse or tit (*P. major*, Linn.), called also oxeye and blackcap in England, and *la charbonnière* in France; it is less than 6 in. long, with the head, fore part of neck, transverse band on sides, and longitudinal one on breast and abdomen, black; cheeks white, back yellowish green, and breast and sides yellow; wings and tail grayish. Its usual note is a loud cheep followed by a harsh chatter, in the spring resembling the filing of a saw and heard to a great distance; it imitates the notes of other birds, and in its habits

Hanging Tit (*Paroides pendulinus*).

and food shows an alliance to the jays; in its search for flies it visits the cottage tops and pulls the straw from the thatch; it is found from Norway and Sweden to the southern boundaries of Europe. The blue tit (*P. caeruleus*, Linn.) is 4½ in. long and 7½ in. in alar extent, with the upper part of the head light blue and encircled with white; band round neck, and before and behind eyes, duller blue; cheeks white, back light yellowish green, under parts pale grayish yellow, and middle of breast dull blue. This is the handsomest and most familiar species; in autumn it quits the woods and thickets and visits the gardens and orchards, incessantly hopping about among the branches, pert and irritable; it is called tomtit, bluecap, bluebonnet, and billy-biter in various parts of England. It is a permanent resident in Great Britain; it is very bold when sitting, hissing

like a snake or angry kitten, and severely biting the hand brought near the nest.—The hanging tit (*paroides pendulinus*, Koch), 4½ in. long, is reddish gray above, with wings and tail blackish, and lower parts rosy white; it is found in eastern and northern Europe, and constructs very artistically a nest woven of the fibres of bark and the cotton of the seeds of willows, fastened to a reed or thin branch and surrounded by closely tangled bushes, which protect it from the wind and hide it from view.

**TITUS**, a N. E. county of Texas, bounded N. by Sulphur fork of Red river, S. by Big Cypress bayou, and intersected by White Oak bayou; area, 940 sq. m.; pop. in 1870, 11,889, of whom 2,818 were colored. The surface is generally level and the soil fertile. The county is well timbered, and contains iron ore. The chief productions in 1870 were 382,029 bushels of Indian corn, 5,632 of oats, 48,343 of sweet potatoes, and 7,089 bales of cotton. There were 3,487 horses, 4,597 milch cows, 10,784 other cattle, 8,798 sheep, 28,711 swine, and 7 saw mills. Capital, Mount Pleasant.

**TITUS** (**TITUS FLAVIUS SABINUS VESPASIANUS**), a Roman emperor, born Dec. 30, A. D. 40, died near Reate in the Sabine country, Sept. 18, 81. He was the son of Vespasian, and was educated in the imperial household with Britannicus, the son of Claudius, who was poisoned by Nero. While still young he served as military tribune in Britain and Germany, and subsequently became quæstor. During the Jewish war he commanded a legion under his father, and captured Tarichæa, Gamala, and other places. When Vespasian, proclaimed emperor by his army, went to Rome, he left Titus to end the Jewish war, which he accomplished in September, 70, by the capture of Jerusalem and the massacre and dispersion of its inhabitants. Subsequently he returned to Rome by the order of his father, carrying with him Berenice, the daughter of Herod Agrippa, with whom he had fallen in love (see BERENICE), and by his prompt obedience proved that the rumors which charged him with aiming at the throne were unfounded. For their common success in the Jewish war he had with his father the honor of a triumph, and the arch of Titus then erected is still standing. (See ROME, vol. xiv., p. 412.) During the remaining years of the reign of Vespasian he was employed in discharging the highest functions of state. He drew up the imperial edicts, and was permitted to write letters in the emperor's name. He ascended the throne in 79, and soon dispelled the impression, produced by some features of his earlier conduct, that he would be another Nero. The people called him *amor et delicia generis humani*, and Suetonius records that he exclaimed, *Amici, diem perdidisti*, whenever a day passed without his being able to do a service to a friend or petitioner. His reign was marked by a succession of terrible calamities, the injuries inflicted by which he made earnest efforts to repair. In 79 the

towns of Herculaneum, Stabiae, and Pompeii were destroyed; in 80 a great fire broke out in Rome which lasted three days, and a plague began to ravage the city, of which thousands died daily. Titus almost exhausted his finances in order to relieve his unfortunate subjects, repaired many aqueducts, made a road from Rome to Ariminum (the modern Rimini), completed the Colosseum, which his father had begun, and also constructed the baths called the baths of Titus. In dedicating these two last, he gave magnificent entertainments, which continued 100 days, on one of which 5,000 wild beasts are said to have been set fighting in the new amphitheatre. He checked all prosecutions of *lesa majestas*, and punished all informers. He pardoned his brother Domitian, who several times had attempted to supplant him. Meanwhile his health declined, and going to the Sabine country, he expired in the same villa in which his father had died. Titus is said to have written Greek poems and tragedies.

**TITUS**, a companion and fellow laborer of the apostle Paul. He was a Greek, and was one of those persons sent from Antioch to Jerusalem to consult the apostles, and it was not judged necessary that he should be circumcised. He accompanied Paul to Jerusalem, was his agent at Corinth and in Dalmatia, and was left with ecclesiastical commissions on the island of Crete. According to ecclesiastical authorities and tradition, he was the first bishop of Crete.

**TITUS, Epistle to**, a canonical book of the New Testament, addressed by the apostle Paul to his disciple Titus. This and the two epistles to Timothy form the pastoral letters of the apostle, all of which have so many points in common that their authenticity has been generally attacked and defended simultaneously. The date of the Epistle to Titus has been the subject of much dispute, some fixing it as early as the year 52, others as late as 65, others at various intermediate years. The apostle furnishes Titus, whom he had left behind in Crete, with rules of conduct for himself, especially in regard to the appointment of elders (i. 5-9), and certain false teachers (i. 10-16), as well as for Christians in general (ch. ii. and iii.). The commentaries on the Epistles to Timothy generally include also the Epistle to Titus. (See TIMOTHY, EPISTLES TO.)

**TITUSVILLE**, a city of Crawford co., Pennsylvania, on Oil creek, 85 m. N. by E. of Pittsburgh, and 40 m. S. S. E. of Erie; pop. in 1870, 8,639; in 1875, about 10,000. It is in the midst of a fine dairy region, and is surrounded by hills. The streets are broad, straight, and well paved; the dwellings are of wood and brick, and are surrounded by gardens; the business blocks are of brick. It is well drained, lighted with gas, and has Holly water works. It communicates with Buffalo, Erie, Pittsburgh, and other points by means of the Dunkirk, Alleghany Valley, and Pittsburgh, the Oil Creek and Alleghany River, and the Union and Titus-

ville railroads. Titusville is the chief place in the oil region, and owes its prosperity to the petroleum wells in the vicinity. It had only 300 inhabitants in 1859, when the production was commenced. It contains seven oil refineries, using 6,000 barrels of crude petroleum daily; three oil-barrel factories, besides a number of cooper shops, together producing 3,000 barrels a day; four iron works and foundries, manufacturing steam engines and boilers, stop-cocks and pipe fittings, and oil-well tools, and also doing brass casting and finishing; two sulphuric acid factories, two flouring mills, two lager-beer breweries, four banks, a high school, four ward schools, two Roman Catholic schools, two daily and weekly newspapers, and 12 churches.

**TIVOLI** (anc. *Tibur*), a town of Italy, in the province and 16 m. E. N. E. of the city of Rome, on the Teverone (anc. *Anio*) and on the slope of Mt. Ripoli; pop. about 6,000. It is remarkable for magnificent scenery and for its antiquities, which include villas, bridges, and the temples of the Sibyl and of Vesta. The celebrated falls of the Anio were best seen from the grottoes of Neptune and the Sirens till 1826, when the artificial wall over which they flowed was destroyed by an inundation. The course of the river was then diverted by cutting two long tunnels through the rock of Mt. Catillo, finished in 1834; the new falls thus formed are exceedingly picturesque, as well as the numerous small cascades in the W. part of the town.—The ancient Tibur, probably a Sicilian city, was one of the early rivals of Rome. As a member of the Latin league, it was, after a protracted struggle, taken in 338 B. C., and deprived of a part of its territory. Remaining nominally independent, it became a resort of Roman exiles. It was famed for the worship of Hercules in one of the most beautiful temples of the period, and for its associations with illustrious Romans who had villas here during the republic and the early days of the empire. The domain of Hadrian, S. of Tibur, extended over 8 m., and included many public buildings besides a magnificent palace. In the middle ages the town again became important. Pius II. built the castle in its present form near the gate Santa Croce.

**TLAXCALA**, or *Tlaxcala* (Aztec, "land of bread"), a state and city of the republic of Mexico. The state is bounded W. by the state of Mexico, and on all other sides by that of Puebla; area, 1,498 sq. m.; pop. in 1871, 121,665. In area it is the smallest of the Mexican states, not including the federal district. It received its name from its great fertility in maize. The city, capital of the state, is between two mountains on an upper branch of the river Mescala, 20 m. N. of the city of Puebla, and 70 m. E. by S. of Mexico; pop. about 5,000. It has a cathedral, state house, bishop's palace, and the oldest Franciscan convent in Mexico.—The Techichimecs founded the Tlaxcalan republic, which successfully resisted all

efforts of surrounding tribes and even of the Mexican monarchy for its subjugation. In 1519 the Tlaxcalans resisted the march of Cortes, but, after being defeated in four battles, they submitted as vassals to Spain, but refused to abjure their religion. (See CORTES.) The city is said to have numbered at the time of the invasion about 20,000 families, and Sept. 18, the day of Cortes's entrance, is still celebrated there.

**TLEMCEN**, a town of Algeria, in the province and 68 m. S. W. of the city of Oran; pop. in 1872, 18,722, including 3,000 French. It is the strongest Algerian fortress on the Moroccan border, and one of the most picturesque places of the country. It has about 30 mosques, the most magnificent being that of Sid Ibrahim. Trade and industry are active, and increasing in consequence of improved communications. It was originally called Jiddah, and for several centuries was, with occasional interruptions, the capital of an independent kingdom, with a population estimated at more than 100,000. Many vestiges of its former splendor remain. (See *Histoire des rois de Tlemcen*, from the Arabic, by the abbé Bargès, Paris, 1852.) In the 16th century it fell under the domination of the Turks, who allotted it to the dey of Algiers. The inhabitants having revolted in 1670, the place was burned. The French, after a brief occupation, restored it in 1837 by treaty to Abd-el-Kader, and they did not recover possession until after partly destroying the town in 1842, since which time they have greatly strengthened the fortifications.

**TOAD**, the common name of a well known family of anurous or tailless batrachians, the general character and anatomy of which have been described under AMPHIBIA and FROG. The *bufonida*, which comprise the common toads, have a well developed tongue, jaws rather sharp at the edge but without teeth, thick and heavy body, and skin more or less covered with glandular warts which secrete an acrid fluid; the hind legs are but little longer than the anterior. According to Agassiz, the toads should rank higher than the frogs, from their more terrestrial habits; the embryonic web, which still unites the fingers of the frog, disappears in the toad, and the cutaneous glands of the skin do not exist in frogs. Toads, like frogs, absorb moisture by the skin, which is cast at intervals, coming off in lateral halves which are swallowed by the animal at a gulp; the skin feels hard to the touch, and, according to Mr. Rainey ("Microscopic Journal," 1855), contains a layer of earthy matter under the dermis effervescing with acids, considered by him the analogue of what becomes a continuous hard dermal skeleton in the testudinata. Like frogs, they have also a large sac resembling a bladder, often found filled with pure water, in no way connected with the kidneys, but formed of the allantois, serving as a reservoir of water and aiding in respiration, its walls being high-

ly vascular. The acrid fluid of the skin may be pressed out from two eminences like split beans just behind the head; it comes forth in a jet, and will make the eyes smart severely if it touches them. The hyoid bone being absent, the root of the tongue is attached anteriorly in the concavity formed by the branches of the lower jaw, the free extremity pointing backward when at rest; it is capable of protrusion in a reversed position so rapidly that the eye cannot follow it. They are not only inoffensive, but of great service to man in destroying noxious insects and larvæ; they usually lie hid during the day, but come out at dusk in woods, fields, and gardens, in search of food, and are not unfrequently found in cellars and dark places about houses; their metamorphoses are of the same character as those described under FROG; they live out of the water except during the breeding season in March or April; during winter they remain torpid in holes and crevices, under stones, stumps, &c.; they lay a great number of eggs

Common European Toad (*Bufo vulgaris*).

united into long strings, enclosed in a gelatinous substance, generally two, which the male draws out with his hind feet. The species are less numerous than in the terrestrial and tree frogs; they are found in both hemispheres, but unequally distributed, being most abundant in America, and least so in Europe, which has not a single species peculiar to it, both the common toad and the natterjack occurring also in Africa and Asia; they are more abundant in Asia than in Africa, and only one is described in Australia; Duméril and Bibron recognize only 85 species of *bufonida*.—In the genus *bufo* (Laur.) the tongue is oblong, free posteriorly; anterior limbs four-toed and free, the posterior five-toed and semipalmated; the tuberosity behind each eye, above the tympanum, porous and cushion-shaped; head obtuse in front, the upper jaw descending directly downward so that the intermaxillaries do not project in front of the cranium. The common European toad or paddock (*B. vulgaris*, Laur.), *le crapaud* of the French, is 3 to 3½ in. long, of a lurid brown-

ish gray, with reddish brown tubercles and a blackish stripe externally or along the glands on the sides of the head; the iris red or golden; the body thick and much inflated. It feeds on insects and worms of all kinds, but will touch only a living and a moving prey; it remains motionless, with eyes fixed on its intended victim till it comes within reach of its tongue, which is darted out with extreme rapidity and accuracy; when it seizes a worm, it pushes it into the mouth with the fore feet till all disappears, and the animal is swallowed whole. Its motions are by a kind of crawl; when alarmed it stops and swells out the body, and sometimes makes short and awkward leaps. The eggs are in a double series, 3 or 4 ft. long and two lines thick, and are laid in the spring two or three weeks later than those of the frog, the young being fully developed by the last of summer; they are smaller and blacker in all their stages than the young of the frog. Small toads of this and the common North American species are often found in places, such as gardens and cellars, where they could neither have had access to water nor have been introduced from without, and therefore could not have gone through the usual stages of tadpole existence; the gills must have disappeared shortly after birth, if they ever existed; they appear to have the power of prematurely assuming the functional conditions of terrestrial animals when circumstances demand it; a similar rapid metamorphosis is observed as a rule in the Surinam toad mentioned below. (See "Annals and Magazine of Natural History," vol. xi., London, 1853.) The toad has been regarded as venomous in almost all countries and ages, its saliva, bite, and cutaneous and watery secretion being supposed to be poisonous and more or less maleficent; the acrid exudation from the skin is sufficient to produce a painful irritation on a tender skin or a wounded mucous membrane; though it will make a dog quickly drop a toad from its mouth, it has no effect when introduced into the circulation; it not only serves thus for the protection of the animal, but is probably partly excrementitious, and assists the lungs in freeing the blood of carbon. The toad has been known to live 85 or 40 years, and it is thought to attain a considerably greater age; it has been so far domesticated as to come and feed from the hand, and seems capable of attachment to man. From their well known fondness for insects, toads make excellent traps for the entomologist, who may thus procure rare and otherwise unattainable beetles and nocturnal species, which they can be made to disgorge without difficulty; gardeners often put them into hot-houses to destroy ants and other insects and larvæ. Like many reptiles, the toad can live a considerable time without food and with a very small supply of air; but the alleged instances of their being found imbedded in solid stone or the heart of a tree, with no possible communication with the ex-

ternal world, have no doubt arisen from errors of observation. Dr. Buckland's experiments in 1825, in connection with the so-called antediluvian toads, show that these animals cannot usually survive a long time, not even a year, deprived of air and food. (See "Curiosities of Natural History," by his son Francis T. Buckland, 1st series, London, 1859, pp. 74-86.)—The other European species is the natterjack, or mephitic or green toad (*B. calamita*, Laur.); it is less than 8 in. long, of a light yellowish brown color clouded with dull olive, and with a bright yellow stripe along the middle of the back; under parts yellowish with black spots, and the legs with black bands; iris yellowish green; it is less tumid, and the eyes more prominent; the hind legs are shorter and the toes less palmated, indicating more terrestrial habits; it is less common, more active, and frequents drier places; it is found throughout Europe, and in Asia and N. Africa.—The common American toad (*B. americanus*, Le Conte) is 2½ to 3 in. long, with short, thick, and bloated warty body; anterior limbs large, posterior short with a spade-like process at root of first toe, described as a rudimentary sixth toe by some writers; the jaws entire, and the eyes large and brilliant. It has a longitudinal line of dirty white from the occiput to the vent, on each side several spots of various colors, size, and shape, and a row of black and whitish ones extending to the hind legs; lower parts granulated and dirty yellowish white; anterior limbs dusky above with small white spots, the posterior ashy with blotches and bands of black. The head is smaller than in the European toad, the body less bloated, and the movements more active. In the breeding season toads and frogs do not generally assemble in the same pond; this species has been found on sandy shores overgrown with beach grass and in salt marshes; it is met with from Maine and Canada to the Mississippi valley; its note is a prolonged trill, continued by day and night.—There are several toad-like batrachians, generally arranged by modern herpetologists in the frog family. One of these, the accoucheur toad (*B. obstetricans*, Laur.; genus *alytes*, Wagler), is common in the vicinity of Paris, France, and in S. Germany; the males not only assist the females in the exclusion of the eggs (which are yellow), but afterward attach them to their hind legs by small pedicles; the young are developed under ground in the femoral region until they reach the tadpole state, when the males enter the water and the young escape.—The family *pipidae* constitute the group of *phrynoglosses*, so named from having no tongue, as distinguished from the *phaneroglosses*, in which this organ exists; the head is triangular, and the small eyes are low and near the mouth; the body is broad and thick, the hind legs very powerful and large, and the toes united by a complete and full web. The family contains only two genera, *pipa* (Laur.) and *dactylethra*

(Cuv.), each with a single species. In *pipa* there are no teeth, and the last joint of the slender anterior toes is divided into four parts. In *dactylethra* the upper jaw has small pointed teeth, the tongue is at the back of the mouth, and some of the hind toes have (alone among batrachians) hoof-like claws; the anterior legs are small and slender; the *D. Capensis* (Cuv.)

Surinam Toad (*Pipa Americana*).

is found at the Cape of Good Hope and on the Mozambique coast. The Surinam toad (*P. Americana*, Laur.) has a remarkable and anomalous mode of reproduction; the eggs do not escape into the water, but are received by the male, who deposits them on the back of the female and there impregnates them (some authors say that impregnation takes place before the deposition of the eggs on the back of the female); the skin becomes thickened between them, rises, and partly invests each egg in a sac or pouch, covered by a thin operculum of dried gelatinous matter, probably a portion of that which originally surrounded the egg; the young go through the usual changes in the dorsal pouches, and emerge perfect toads; the yolk is large; the external branchiæ disappear at a very early period; the tail is fully formed in the embryo, but is absorbed before it leaves the egg; the embryo at this stage is larger than the original egg, so that it must have absorbed something from the pouch of the parent. This animal is commonly found in the dark corners of houses in Guiana, and, though very large and exceedingly disgusting in appearance, is said to be eaten by the natives.

**TOAD FISH**, a spiny-rayed fish of the *lophius* family, and genus *batrachus* (Bloch), so named from its large head, wide gape, usually naked skin, and disgusting appearance; it is also called frog fish and oyster fish. The head is flattened and wider than the body; teeth conical, small and crowded on the intermaxillaries, larger on the lower jaw, palate, and vomer; operculum small and spiny; head, lips, and cheeks provided with numerous fleshy appendages; lower jaw the longer; first dorsal short,

with three spinous rays almost concealed in the skin; second dorsal and anal low, soft, and long; ventrals under the throat, narrow, with three rays; pectorals on short arms of five carpal bones; fourth branchial arch without gills; body generally scaleless; no pyloric cæca; air bladder deeply forked anteriorly, attached to the vertebrae by slender ligaments, and muscular on the sides. They hide in the sand and mud of salt water, and occur in both hemispheres, preying on fish. There are more than a dozen species, of which one of the best known is the grunting toad fish (*B. grunniens*, Bloch), found in the seas of the East Indies; the skin is naked, smooth, soft and spongy; the head and jaws with numerous cutaneous appendages; the color is brownish above, marbled with darker, below white, fins white with brown bands; it is 8 to 13 in. long, and is said to be eaten at Bombay; it received its specific name from its making a grunting noise like a pig, from the expulsion of air by the muscular air bladder through the mouth.—The common American toad fish (*B. tau*, De Kay) is much like the East Indian, with half a dozen more rays in the second dorsal and anal, stronger teeth, more prominent dorsal spines, and rather darker colors; it is 8 in. to a foot long, light brown, marbled with black, and the fins with black lines; the body is covered with a copious viscid secretion; the mouth very large, and the chin and cheeks with numerous fleshy appendages. It is found from Maine to the gulf of Mexico and the West Indies, on the New England coast usually in ponds and lagoons connected with the sea, in muddy shoal water, or under eel grass and stones. The disgusting appearance of this fish, its slimy body, goggle

American Toad Fish (*Batrachus tau*).

eyes, and immense mouth, have generally prevented the use of its flesh as food, though it is said to be delicate, palatable, and wholesome; it is a savage biter, and capable of inflicting severe wounds. Other species are found in the Indian and African seas, and some larger ones with soft scales on the Brazilian coast.

**TOBACCO**, the plant and the dried and prepared leaves of *Nicotiana tabacum* and other species of *Nicotiana*, a genus of the *solanaceæ* or nightshade family. (See *SOLANUM*.) The name of the genus commemorates that of Jean Nicot, a French ambassador to Portugal, who in 1560 sent the seeds from Lisbon to France, as those of a highly valuable medicinal plant which was then known throughout Portugal, having been introduced in 1520. The botanical specific name, and the common name, come

from *tobago* or *tabaco*, the native term in Santo Domingo for the tube or pipe through which the smoke of the burning leaves was inhaled. The native Brazilian name for the plant was *petum* (now used as a generic name for the related *petunia*), which the Portuguese introduced into Europe, and it is occasionally met with in old works. The genus *Nicotiana* is mostly American, containing about 50 species, mainly herbs, with leaves, stems, &c., covered with viscid hairs; calyx tubular-bell-shaped and five-lobed; corolla funnel-shaped, with a five-lobed limb; stamens five, inserted on and included by the corolla; ovary two-celled, ripening into a two-celled capsule, surrounded by the persistent calyx, and opening by two or several valves for the escape of the numerous, very small, kidney-shaped, roughened seeds. The species most generally cultivated is *N. tabacum*, a stately plant, 3 to 6 ft. high, with ample, oblong-lance-shaped leaves, which are

Tobacco Plant in Flower (*Nicotiana tabacum*).

mostly decurrent upon the stem, and decrease in size toward the summit of the plant; the flowers are in a large terminal panicle, the rose-purple corolla about 2 in. long., with a somewhat inflated throat and short lobes. This species was extensively cultivated by the natives before America was visited by Europeans, and has not been detected in a truly wild state. *N. rustica*, according to Humboldt, was largely cultivated by the ancient Mexicans, as it was by the more northern aborigines; it is occasionally found as a weed as far north as New York state, and occurs in various other parts of the country as a relic of its cultivation by the Indians; though a native of tropical America, it is more hardy than the common species; it was early introduced into cultivation in Europe, and has become naturalized in the southern parts of that continent. It has ovate, petioled leaves, and dull greenish yellow flowers, which are much smaller than those of *N. tabacum*. As its leaves in drying retain much

of their color, it is sometimes called green tobacco, and being earlier and more hardy, it is better suited to northern localities than the common species; it comes to maturity in Canada, and is cultivated in northern Germany, Sweden, and Russia, and various eastern countries; the Turkish, Hungarian, and Latakia tobaccos are of this species. Chinese tobacco is accredited to *N. Chinensis*, and that of Shiraz to *N. Persica*, species of doubtful origin and identity. *N. repanda* is said to be raised in Cuba for the manufacture of a particular brand of cigars. The tobacco formerly cultivated by the Indians of Missouri and further west was, according to Nuttall, *N. quadrivalvis*, a low, much branched plant, with short, lanceolate, sessile leaves, and nearly white flowers, opening only at sunset; its native country is unknown.—Tobacco is largely produced in China, Japan, Persia, and other parts of the East, in some of which the plant has become so thoroughly naturalized that an eastern origin has been sometimes claimed for it; but Alphonse de Candolle, after a thorough study of the subject, finds no satisfactory evidence that its uses and culture were anywhere known before the discovery of America.—In speaking of the cultivation and uses of tobacco, the common species, *N. tabacum*, is intended, unless otherwise mentioned. Like some other plants of the family, as the potato and tomato, tobacco readily adapts itself to new conditions, and it becomes to a certain extent acclimated. The influences of climate and soil upon the development of plants are strikingly illustrated in tobacco as cultivated in the United States; it is grown from near the borders of Canada to the gulf of Mexico, and almost from ocean to ocean, and several states produce a leaf of such well marked characteristics that a good judge can at once tell the locality of its growth. The valley of the Connecticut produces a leaf which is large, thin, and remarkably fine and silky, and which, though deficient in flavor, is so superior for wrappers, or the outer covering of cigars, that it is even sent to Cuba for that use. In the attempts to improve the flavor of the tobacco of the Connecticut valley, seeds from Cuba and other localities have been tried there; but it is found that in a very few seasons the tobacco, from whatever source the seeds are obtained, becomes similar to that which has long been raised there; it has also been found that when Connecticut valley seeds are sown in other localities the plants in two or three generations give a product almost precisely like that peculiar to the locality.—The first European cultivation of tobacco took place in Portugal, in the early part of the 16th century; it was raised in France in 1572, a box full of powdered leaves having been sent to Catharine de' Medici, who acquired a taste for it, and the plant was for a time called *herbe de la reine*. The culture rapidly extended to other parts of Europe and to Asia,

in some cases being checked by severe laws or made useful as a source of revenue. Its production in England, by a law of 1660, was restricted to a very small quantity for medicinal purposes, and the prohibition still remains in force. The earliest settlers in Virginia engaged in the cultivation of tobacco, as it was a salable commodity in England; but as early as 1616, when the colony only numbered 851 persons, a provision was made by law against neglect of food crops in its favor.—In the cultivation of tobacco the first step is to sow the seeds in a seed bed; the success of the crop greatly depends upon the management of this. A spot with a warm exposure and well sheltered is selected, a temporary fence being sometimes put up to protect it from the winds, and as soon as the soil is thawed the bed is highly manured and spaded or ploughed. It is very common to put upon the bed a covering of brush, burn it, and rake the ashes into the soil; this burning destroys all the seeds of weeds near the surface, and leaves the soil in good condition. The seeds of tobacco are so exceedingly minute that it is said an ordinary thimbleful, if each germinated, would produce more than enough plants for an acre; but, as is usually the case with very small seeds, a large proportion of them will be covered too deeply and fail. The surface of the bed being raked fine, the seed is carefully mixed with several quarts of lime, ashes, sand, or other material to aid in its distribution, and sown with the greatest care broadcast, and the surface well rolled. After sowing, the bed receives the closest attention; watering when needed, applying liquid manure, covering with mats or straw on cool nights, and when the plants are well up killing destructive insects and weeding, are among the labors needed to insure success. When the plants are about 4 in. high they are ready to be transplanted; the field is previously prepared, and can hardly be made too rich; stable manure and a great number of artificial fertilizers are applied to this most exhausting crop; the land is marked out in rows 3 ft. apart one way and 2 ft. the other for small varieties, which will give 7,000 plants to the acre, while for larger kinds the rows are 3 ft. one way and 4 ft. the other, allowing 4,200 plants to the acre. Transplanting is done in cloudy weather, the plants being set at the intersection of the rows; they soon become established, and during their growth receive the most thorough cultivation. When the leaves are as large as one's hand, the tobacco needs "worming." Various insects attack it, but the most destructive is the large "green worm," the larva of a sphinx; the common tobacco worm in western states is *sphinx carolina*, but *S. quinque-maculata*, commonly found on the potato and tomato, feeds upon tobacco in the eastern states; both are large, night-flying moths, with five inches spread of wing and a long coiled proboscis; in their larval state they eat voraciously and

grow rapidly, forming when full grown a caterpillar 8 in. long, as large as one's finger, and having an ornamental horn (not a sting) at its tail end. These will ruin the leaves in a short time; the whole farm force is frequently needed to "worm" the tobacco, and it must be guarded from these attacks during its whole growth; the worms are killed by pinching them between the thumb and finger. When the plants and the worms are small, a flock of young turkeys may be employed, but later in the season there is no substitute for hand picking. Some have killed the parent insects by placing sirup poisoned with arsenic in the large tubular flowers of the common thornapple or Jamestown weed (*datura stramonium*) and placing these about the field. "Priming" is the name given to the breaking off of such leaves as touch the ground and become broken and soiled; this is not practised by all planters, some preferring to cure all the leaves and put the poor ones by themselves. "Topping" is the stopping of the upward growth of the plant by breaking off the upper end of the stem, in order that the nourishment which would otherwise go to the production of flowers and seed may be diverted to the greater development of the lower leaves; some top when the first blossom buds show, and others leave a given number of leaves, 10 to 16, as experience has proved most profitable. The upward growth of the plant being checked by topping, branches soon appear in the axils of the leaves; these are called suckers, and the operation of removing them is "sucker-ing," which is done as soon as those on the upper part of the plant are large enough to get hold of, and the laborious work must be kept up as long as any suckers appear. The maturity of the crop is judged of by the color and the feel of the leaf; over-ripeness is more injurious than its opposite. Cutting is sometimes done as soon as the dew is off in the morning, and the tobacco housed as soon as wilted; others cut in the afternoon, and house the next morning. A hatchet or a knife like a corn knife is used, the stalk being severed close to the ground with one blow, and laid down, where it remains long enough to wilt so that it may be handled without breaking the leaves, but not so long as to be sun-burned. Where it is an important crop, large buildings (tobacco houses) are erected expressly for it; these are so arranged that the ventilation is under perfect control; there are several ventilators in the roof, and each alternate board of the upright siding is hung on hinges, and so arranged that all may be opened or closed at once; the best houses are provided with a stove. The methods of hanging tobacco to dry vary greatly; the old way is to hang the plants upon poles, which are supported at each end by timbers arranged for the purpose; the plants are tied to the poles with a strong twine; they hang tops downward, and are placed upon alternate sides of the pole and such distances

apart that the leaves will not touch. A very common way of hanging is on laths; these are 4 ft. long, 1½ in. wide, and ¾ in. thick; an iron spear about 8 in. long, with a socket to fit upon the lath, is placed upon one end, and by its means the tobacco is strung upon the lath, the spear passing through the stalk near its larger end; this work is done in the field, and the laths with their load are hung upon rails in the barn. Besides these methods of hanging there are several patented contrivances intended to facilitate the work and at the same time keep the plants far enough apart. During the drying close attention must be paid to ventilation; as the leaves dry they must not be broken by the wind; if hung too close, the tobacco will "pole burn;" if it does not dry quickly enough, the green leaves may freeze and be spoiled; fire heat is often used, which improves the color, but is objected to by some as injuring the flavor; it ordinarily takes about 12 weeks to cure. When quite cured, the tobacco is stripped; the house is opened in a damp time, and when the leaves have absorbed so much moisture from the air that they will not break, the tobacco is taken from the poles and put in piles, where it will remain pliant for a week. In stripping, the leaves are at the same time assorted, four qualities being usually made. The first stripper takes a stalk and picks off all the defective leaves near the base, and throws it to the next; the second stripper removes all of the next quality, and so on; the leaves are kept even and smooth, and when the stripper gets enough for a "hand," which is 8 or 4 oz., he binds them

Hand of Tobacco.

together into a bunch by means of another leaf. Up to this stage the tobacco is simply the dried leaves, without the aroma and other qualities for which it is esteemed; these are developed only after it has undergone a fermentation or is "conditioned," to effect which the leaves are "bulked." The merchants who purchase the tobacco frequently prefer to "condition" it in their own warehouses; when this is the case, the hands are simply baled for transportation. "Bulking" consists in stacking the tobacco in a compact heap, the butts of the hands laid outward, the leaves being carefully smoothed as they are placed down; in a rude way the bulk is made on a platform of boards raised above the ground sufficiently to allow of a circulation of air beneath; when the pile is 3 or 4 ft. high, planks and weights are placed upon it, and it is covered if need be with blankets. In this state it remains until

the color, flavor, and other qualities are properly developed, which requires from four to six weeks. Bulking being the finishing process, the quality of the crop depends upon its proper management, and it requires frequent attention. Tobacco is sent to market in boxes containing about 400 lbs., or in casks holding 1,300 to 1,500 lbs.; in packing in casks the butts of the hands are laid toward the outside and trodden down by the bare feet of the packer; when about 100 lbs. are thus packed, pressure by means of a screw or a powerful lever is applied, after which more tobacco is placed in, pressed again, and so on till the cask is full.—The yield of marketable tobacco to the acre depends upon numerous contingencies; but the average is not far from 600 lbs., while some growers harvest 1,000 lbs. annually, and this is exceeded in particular cases. Tobacco growers are very careful in the matter of seed; the tendency of the plant to vary has already been noticed, and it is the custom of some growers to save a large supply of seed from a desirable crop, as when well kept it remains good for six to ten years.—The various kinds of foreign tobacco are known by the names of the countries producing them, or the ports whence they are shipped, such as Havana, Orinoco, Turkey, Latakia, Shiraz, &c.; that grown in this country bears the name of the state or some particular locality, while the product of the Connecticut valley and some other localities bears the unmeaning name of "seed leaf." Virginia tobacco is one of the strongest kinds, not fitted for cigars, but is made into various shapes for pipes, and for chewing, and used for snuff; Maryland is paler and weaker, and used for pipes; Kentucky is intermediate between the two, and in this as with the Missouri there is much variety; the Florida is now becoming known as a fine tobacco, and used for cigars; the best of the northern kinds for making cigar wrappers is the Connecticut, and those from New York, Ohio, and other northern states are valued in proportion as they approach this in texture, as for this use strength or flavor is not required; the body of the cigar being made of Havana, a leaf that has an attractive color and silky feel is sought for. (See CIGAR.) The Turkish and other kinds from the East are only used cut fine for pipes, or granulated for cigarettes. Manila tobacco is imported only in the form of peculiar conical cigars called cheroots. Very fine tobacco is produced in Paraguay, and small quantities have been imported.—In whatever manner the tobacco may be manufactured (except for snuff), the first step is to "strip" it. The hands, being moistened to prevent breaking, are untied, and the strong midrib of the leaf is removed; this work is done by women and children; the upper surfaces of the leaf are folded together lengthwise, and the midrib dexterously separated by a pull; the "stems," as the midribs are called, are used in the poorer kinds of cut tobacco and snuff, but are nearly

a waste product, being sold at low rates for making sheep dip to destroy ticks on those animals, and for fumigating greenhouses to destroy insects. Some tobacco is sold which seems to be of the leaf merely stripped, made into a roll, and subjected to moderate pressure, without any foreign substance, and some of the cut tobacco is of this kind; but the greater part of that made up into cakes, heads, plugs, or pigs, as the parcels are variously called, as well as that which is cut for both smoking and chewing, is prepared by various processes to meet the taste of the consumers; molasses, liquorice paste, a decoction of figs, and glycerine are used to impart a sweet taste, give color, and prevent rapid drying; common salt and other salts are used for flavoring, and nitrate of potash or soda is sometimes added to increase the combustibility; anise and other aromatics are added for their flavor, and smoking tobaccos have their odor increased, if not improved, by the use of cascarilla bark, and lately *liatris odoratissima*, the leaves of which are largely collected in Florida and sold as "wild vanilla" or deer's-tongue (see VANILLA); these contain a great deal of coumarine, the aromatic principle of the Tonqua bean, a seed employed for scenting snuff. These additions, except those for odor, are made in the form of a liquid technically termed "liquor" or "sauce," in which the leaves are steeped.—To make cut tobacco, the leaves are made up into large cakes, which are cut into shreds or filaments by the action of machines similar in principle to straw-cutters. In this condition the tobacco is put up in a great variety of packages, which are marked with fanciful names. The dark-colored leaves, made still darker by the liquoring process, produce the coarse variety called shag, and the better sorts are converted by spinning processes into cords variously folded or twisted, and distinguished by different names. The term "negro head" is applied to coarse rolls of tobacco weighing 6 or 8 lbs. each. The variety known as "pig-tail" is also spun; the cord, but little larger than a pipe stem, is often braided, and then oiled and packed closely in kegs. In the United States a great deal of tobacco, intended chiefly for home consumption, after being cut up, is made into flat cakes, which are moistened with molasses and powerfully compressed; these cakes are about 5 in. long and 1½ in. wide, and when closely packed in the strong oak boxes in which they are sent to market, they form a compact mass, from which the cakes are torn out only by the application of considerable force; this, known as plug or Cavendish tobacco, is in common use for chewing, and is smoked in pipes by those who are fond of tobacco of the strongest flavor.—Snuffs vary greatly in quality, the poorer kinds being made from the "stems," or midribs of the leaves, separated in preparing tobacco for other purposes; in the finer kinds these are rejected, the blade or better portion of the leaf only being used; and in interme-

diate qualities both parts are ground up together, and the refuse or dust from the cutting machines is used. There are two principal classes of snuffs, the dry and the moist. The dry snuffs are prepared from tobacco which has been exposed to a high temperature before grinding, and they differ in quality according to the proportion of stem they contain; they are usually very finely powdered, of a light yellowish brown color, and from their excessive dryness are very diffusible in the air, and need careful handling; lime is said to be sometimes mixed with these snuffs, to increase their dryness, and those so treated have an injurious effect upon the membranes of the nose. The Scotch or yellow snuff is the commonest of this class; this is usually packed in bladders; yellow ochre is often added to improve the color and as a cheap adulteration to increase the weight. The names of some of the brands indicate the method of preparation, such as "high-dried" and "high toast." The Irish and Welsh snuffs belong in this class; one of the most celebrated Irish brands is Lundy Foot, taking its name from the original makers, Lundy, Foot and co. The moist snuffs present a greater number of varieties. They are prepared by grinding the tobacco while moist, and are subjected to various manipulations. The finely divided tobacco is moistened, usually with a solution of salt, and placed in a heap to ferment; the extent to which this fermentation is carried, the fineness of the subsequent grinding, the addition of perfumes, and the admixture of other substances to increase the pungency or to maintain its moist condition, all vary in producing the different commercial varieties. Carbonate of potash, in the form of pearlash, readily attracts moisture from the atmosphere, and is sometimes added to keep the snuff damp. Salt is added to all moist snuffs, and is not regarded as an adulteration, as it is considered necessary to prevent mould. Various essential oils are used to perfume particular brands, the most common being those of bergamot and rose; powdered orris root and rosewood are both used for this purpose. The color of the snuff is due to the extent to which it is fermented. The leading brands of moist snuffs are rappees (Fr. *rapier*, to rasp) of various kinds (coarser-grained than other varieties), prince's mixture, maccoboy (Fr. *macouba*), Dutch carrottee, Grand Cairo, &c. Snuff is much more largely consumed in Great Britain and France than in the United States. In Scotland the rappee snuff is generally preferred, the so-called Scotch snuff being used chiefly by women of the lower classes.—The first analysis of tobacco was made by Vauquelin in 1809, who detected a volatile acrid principle, which was not isolated till 1828, by Posselt and Reimann, as a colorless oily liquid, which was called nicotine or nicotia, and is the constituent upon which the active properties of the plant chiefly depend. (See NICOTIA.) The proportion of this alkaloid

in the dried leaves varies from less than 2 per cent. in Havana to nearly 8 per cent. in tobacco produced in the department of Lot in France. The occurrence of nicotia in tobacco smoke is asserted by some chemists, while others have failed to detect it. Another constituent is tobacco camphor, or nicotianine, a concrete volatile oil which appears on the surface of the distillate as minute crystals when the leaves are distilled with water; very discrepant accounts are given of its sensible properties, which have not been sufficiently studied. Besides these the leaves contain a bitter extractive matter, gum, malate of lime, chlorophyll, albuminoids, malic acid, woody fibre, and various salts. The amount of ash is very large, varying from 16 to 27 per cent. Wolff found in 1,000 parts of air-dried leaves 197.5 of ash, composed as follows: potash, 54.1; soda, 7.3; magnesia, 20.7; lime, 73.1; phosphoric acid, 7.1; sulphuric acid, 7.7; silica, 19.0; chlorine, 8.8. The leaves contain from  $2\frac{1}{2}$  to  $4\frac{1}{2}$  per cent. of nitrogen, partly in the form of nitrates; this, with the large content of potash and phosphoric acid, shows the heavy draft made by the crop upon the fertility of the soil, which can only be maintained by the most liberal manuring. By dry or destructive distillation at a red heat, an empyreumatic oil is obtained, of about the color and consistence of molasses, with acrid taste, and precisely the odor of an old pipe; this is powerfully poisonous; under the name of oil of tobacco it is used in ointments for skin diseases. This oil has been detected in tobacco smoke together with nicotianine (as some assert), nicotia, salts of ammonia, hydrocyanic acid, sulphuretted hydrogen, several volatile fatty acids, phenol, creosote, and numerous basic substances of the picolinic series. It appears therefore that the physiological effects of smoking cannot be directly deduced from, although closely allied to, those of tobacco administered by the mouth or otherwise.—The admixture of some of the materials used in the processes of manufacturing tobacco cannot be properly called adulterations, as they are added to suit the tastes of consumers. Water, necessary to bring the leaf into proper form, may be sometimes fraudulently used to increase the weight, and those who keep the unmanufactured tobacco in store are careful that it shall not lose in this respect; the other additions, of various saccharine and saline matters, have already been mentioned. In England, where tobacco bears a high price, there is a temptation to add other materials, and, especially in cut tobaccos, various vegetable substances have been detected; dock, rhubarb, coltsfoot, and other leaves, malt sprouts, and peat are among the most important; but the use of these is not frequent, as detection in the adulteration of tobacco, and even their possession by a tobaccoist, are punished by a fine of £200. The microscope serves for the detection of these adulterations, the structure of the true leaf

being quite distinct from that of any likely to be mixed with it. The various salts, such as nitrates to increase the combustibility, and others to modify the flavor or to increase the weight, are detected by chemical tests. Snuff is more liable to adulteration than any other form of tobacco; common salt is a very frequent addition; ochres and other earthy matters, pearlash to absorb moisture, oxide of lead, and various other foreign substances, including powdered glass (supposed to be accidental), have been detected.—The medicinal effects of tobacco upon the system are very marked, whether it is taken internally or applied externally. In small quantities, taken by either of the methods in which it is commonly used, as smoking, chewing, or snuffing the pulverized dry leaf, it acts as a sedative narcotic; in larger quantities, or with those unaccustomed to it, it causes giddiness, faintness, nausea, vomiting, and purging, with great debility; as the nausea continues with severe retching, the skin becomes cold and clammy, the muscles relaxed, the pulse feeble, and fainting and sometimes convulsions ensue, terminating in death. Its power of causing relaxation of the muscular system is great, and has been taken advantage of in surgical treatment, as by Dr. Physick in a case of obstinate and long continued dislocation of the jaw, the desired effect being produced by smoking, to which the patient was unaccustomed. An infusion or the smoke of tobacco has been introduced into the rectum to facilitate the reduction of a hernia or intestinal obstruction; but it is now entirely superseded for these purposes by the more effectual and less dangerous ether or chloroform. Its physiological action is nearly opposed to that of strychnia, to which it has been used as an antidote. It is also applied in the form of infusions and cataplasms to relieve various spasmodic affections, and its use generally in medicine is in external applications, the nausea it occasions almost wholly preventing its exhibition internally. It is recommended in articular gout, rheumatism, and neuralgia; and the toothache is often relieved by smoking a cigar. The application of the infusion, or even of the leaves, or of powdered tobacco, to surfaces deprived of the cuticle, has sometimes been attended with fatal effects; these have even followed the inhalation of the smoke. The powerfully nauseating effects of tobacco suggest its use as an emetic, but it is rarely resorted to for this purpose. Entirely different opinions have been entertained by the most respectable medical authorities as to the effects of tobacco upon the system, whether beneficial or hurtful, as it is commonly used; and ever since its early introduction many have earnestly condemned it for its supposed universally injurious qualities. Its use nevertheless has been constantly increasing, and multitudes among all nations depend upon it daily, suffering extremely if deprived of it for a time. Attempts have been made to show that the use

of tobacco lessens mental vigor, but it would be very easy to produce abundant instances to prove that its action in this direction can be but slight. Its use, however, is specially to be avoided by persons who have not reached their full bodily development. Medical authorities are able to trace pretty clearly to its extreme use certain forms of pharyngitis, dyspepsia, palpitation of the heart, and so-called nervousness. A form of blindness known as tobacco amaurosis is recognized by oculists; this is sometimes, but not usually, attended by actual atrophy of the optic nerve, and is generally very amenable to treatment.—In Spain and Spanish American countries women smoke as well as men, while in England and North America the use of tobacco by women, except in the form of snuff, is very rare, and the use of snuff by women is becoming less frequent. The use of snuff for "dipping" appears to be peculiar to the southern states; it avoids the unpleasant effects of snuffing, and has been largely practised in secret as well as openly; it is done with a small brush, which is first wetted, then dipped in snuff, and applied to the gums; it is thought to brighten the eyes and improve the complexion of the young, but the older soon abandon it for the pipe.—The general estimate of the crop of leaf tobacco in 1875 is: Virginia, 65,000 hhds.; Maryland, 35,000; Ohio, 15,000; Kentucky and Tennessee, 100,000; Illinois and Indiana, 30,000; Missouri, 30,000; total, 275,000 hhds. In January, 1876, the average values of leaf tobacco per hhd. were: Kentucky, \$150; Virginia, \$120; Maryland, \$60; Ohio, \$60; at which rates the total value of the estimated crop of 1875 would be \$29,400,000. The annual consumption in the United States is estimated at 60,000 to 75,000 hhds. Of seed-leaf tobacco the stock on hand on Jan. 1, 1875, was 180,000 cases; exported during the year, 35,000; consumption, 70,000; packed in hogsheads and for cutting purposes, 10,000; total, 115,000; leaving stock on hand Jan. 1, 1876, 65,000 cases, to which must be added the estimated crop of 1875, as follows:

STATES.	Cases.	Price.	Value.
Connecticut and Massachusetts..	40,000	\$70	\$2,800,000
New York.....	10,000	80	800,000
Pennsylvania.....	80,000	60	1,800,000
Ohio.....	15,000	80	450,000
Wisconsin and other W. states..	10,000	85	800,000
Total.....	105,000	..	\$5,650,000

The receipts and shipments of American leaf tobacco at the principal tobacco ports in the United States in 1875 were as follows:

PORTS.	Received, hhds.	Shipped, hhds.
New York.....	46,999	54,581
New Orleans.....	4,017	4,447
Virginia.....	88,966	92,450
Baltimore.....	40,290	42,980
Total.....	180,205	124,658

The exports of all kinds of tobacco from the port of New York in 1875 were: leaf in hhds., 54,881; cases, 30,668; bales, 45,122; ceroots, 18,515; stems in hhds., mostly to Germany, 2,253; manufactured tobacco, 6,554,936 lbs. The greater part was distributed as follows:

COUNTRIES.	Hhds.	Cases.	Bales.	Ceroots.
Great Britain.....	16,108	751	88	.....
Germany.....	3,838	22,516	28,000	12,754
Spain.....	11,718	.....	.....	.....
France.....	8,909	50	25	761
Italy.....	12,625	.....	.....	.....

Manufactured tobacco was exported as follows: to Great Britain, 2,866,560 lbs.; Germany, 86,718 lbs.; West Indies, 754,365 lbs.; South America, 1,109,155 lbs.; Australia, 1,246,262 lbs.; and in less quantities to Belgium, Holland, Portugal, the Mediterranean, Africa, the British North American provinces, China, and India. The receipts of Cuban tobacco in the United States in 1875 were 82,819 bales.—See Joubert, *Nouveau manuel du fabricant de tabac* (Paris, 1844); Hassall, "Adulterations detected in Food and Medicine" (London, 1857; new and enlarged ed., 1876); H. P. Prescott, "Tobacco and its Adulterations" (London, 1858); "The Uses and Abuses of Tobacco," by John Lizars, professor of surgery (Edinburgh; reprinted, Philadelphia, 1859); Fairholt, "Tobacco, its History and Associations" (London, 1859; new ed., 1875); "Tobacco Culture, by Fourteen Experienced Cultivators" (New York, 1863); and "Tobacco," by John Dunning, in the "British Manufacturing Industries" (1876).

#### TOBACCO PIPE. See PIPE, TOBACCO.

**TOBAGO**, an island of the Windward group of the British West Indies, the N. point of which is in lat. 11° 25' N., lon. 60° 32' W., 32 m. long; area, 120 sq. m.; pop. in 1871, 17,054. It is a mass of rocks which rises abruptly on the N. E. side and descends toward the S. W., the most elevated part of which is about 900 ft. above the sea. There are several good harbors on the N. side for vessels of 150 tons, and a few on the S. side. The valleys are well watered by numerous streams. The productions are sugar, molasses, and rum. The value of imports in 1874 was £43,743; of exports, £45,280. It has a lieutenant governor, subordinate to the governor of the Windward islands, a privy council, a legislative council of 7 members, and a house of assembly of 16 members, elected by the parishes. The capital is Scarborough, on the S. coast.—Tobago was discovered by Columbus in 1498, and was ceded by France to Great Britain in 1763.

**TOBIT**, a book of the Old Testament in the Roman Catholic canon, but regarded as apocryphal by Jews and Protestants. It contains the history of Tobit or Tobias, a pious Jew of the tribe of Naphtali, living in exile at Nineveh. Being purveyor to the court of King Sardanapalus, he became wealthy; but under

Sennacherib he lost his position and his property, because he had buried Jews who had been executed. Having returned to Nineveh after the death of Sennacherib, he became blind; but he was cured by the application to his eyes of the gall of a fish which his son Tobias had brought home from a journey undertaken in company with the angel Raphael. The Greek text of the Septuagint, which some writers believe to be the original, and the Latin translation of Jerome, which he claims to have made from a Chaldaic text, differ considerably. The author is supposed to have been a Jew of Palestine, who, according to Ewald, most probably wrote in the far East about 350 B. C. Among the best commentaries are those of Fritzsche (Leipzig, 1858), Sengelmann (Hamburg, 1859), and Reusch (Freiburg, 1857).

**TOBOLSK.** I. A government of Russia, in western Siberia, extending from the Arctic ocean to the Central Asian provinces of Akmo-linsk and Semipolatsinsk, separated on the west by the Ural mountains from European Russia, and bounded E. by Yeniseisk and Tomsk; area, 581,964 sq. m.; pop. in 1870, 1,086,848. It is traversed by the Obi and its principal tributaries, and contains extensive lakes. Timber abounds in the south. Its great mineral resources are not yet properly explored. The land on the banks of some of the rivers yields much grain. Fish and game, including fur-bearing animals, are especially plentiful. The transit trade with China is considerable. II. A city, capital of the government, on the right bank of the Irtysh, at the confluence of the Tobol, nearly 1,200 m. E. N. E. of Moscow; pop. in 1867, 20,830. It contains a cathedral and many other churches, several mosques, an episcopal palace, an arsenal, a theatre, and a gymnasium. Inside the citadel is a workhouse for Siberian exiles of the lower classes. The manufactures are unimportant.

**TOCANTINS,** a river of Brazil, formed by the Almas and Maranhão, which rise in the province of Goyaz and unite in lat. 14° S., lon. 49° 15' W. After a course of about 1,000 m., in a general northerly direction, it falls into the Rio Pará, about 80 m. S. W. of the city of the same name. The Araguay, Parannan, Great Somno, Tucahunas, and Theresa are its affluents. The tide ascends about 800 m., and at its mouth the Tocantins is 9 m. wide.

**TOCQUEVILLE,** Alexis Charles Henri Clérel de, a French author, born in Paris, July 29, 1805, died in Cannes, April 16, 1859. He studied law, was appointed a judge in Versailles in 1826, was promoted in 1830, and in 1831 was sent with Gustave de Beaumont on a mission to the United States, to examine the penitentiary system. The report of their observations was published under the title *Du système pénitentiaire aux États-Unis* (8vo, 1832; translated into English by Francis Lieber, 8vo, Philadelphia, 1833). De Tocqueville investigated at the same time the political and social institutions of the country, and wrote his cele-

brated philosophical work *De la démocratie aux États-Unis* (2 vols. 8vo, Paris, 1835), which received the Montyon prize, and procured his admission to the academy (1844). He was elected in 1839 to the chamber of deputies, and became the leader of a moderate wing of the opposition. As a member of the constituent assembly in 1848, he opposed socialistic doctrines and ultra-democratic measures. After attending the diplomatic conferences in Brussels upon Italian affairs, he became minister of foreign affairs, June 2, 1849. He strongly supported the French expedition to Rome, but, dissatisfied with Louis Napoleon in other respects, he resigned at the end of October. On Dec. 2, 1851, he protested against the *coup d'état*, and was imprisoned, but released after a few days, when he retired to private life. In 1856 he published *L'ancien régime et la révolution* (8vo; translated by J. Bonner, 12mo, New York, 1856). His *Œuvres et correspondance inédites* have been published with a biographical notice by G. de Beaumont (2 vols. 8vo, 1860; English translation, 2 vols. 8vo, London and Boston, 1861). His complete works are in 9 vols. (Paris, 1860-'65). His "Democracy in America" was translated into English by Henry Reeve, with a preface and notes by John O. Spencer (8vo, New York, 1838; new ed., London, 1875; abridged ed., "American Institutions and their Influence," with notes, 16mo, New York, 1856); and Reeve's translation has been edited by Prof. F. Bowen (2 vols. 8vo, Cambridge, 1862).—See "Correspondence and Conversations of Alexis de Tocqueville with Nassau William Senior," edited by M. C. M. Simpson (2 vols., London, 1872).

**TOD, James,** an English soldier, born in 1782, died in London, Nov. 17, 1835. He went to India in 1800 as a cadet in the East India company's service, and attained the rank of lieutenant colonel. After the Mahratta war, he was engaged to survey Rajpootana, of which a topographical map was finished in 1815. He was political agent of Mewar and other Rajpoot states from 1817 to 1823. He wrote "Annals and Antiquities of Rajasthan" (2 vols. 4to, London, 1829-'32), and "Travels in Western India" (4to, 1839).

**TODD.** I. A S. W. county of Kentucky, bordering on Tennessee, and drained by Pond river and several large creeks; area, 350 sq. m.; pop. in 1870, 12,612, of whom 4,860 were colored. The surface is generally hilly and the soil fertile. It is intersected by the Louisville and Nashville and Great Southern and the St. Louis and Southeastern railroads. The chief productions in 1870 were 178,837 bushels of wheat, 445,275 of Indian corn, 57,375 of oats, 13,490 of sweet potatoes, 2,620,193 lbs. of tobacco, 18,925 of wool, 65,260 of butter, and 1,633 tons of hay. There were 2,363 horses, 1,789 mules and asses, 2,000 milch cows, 2,423 other cattle, 7,800 sheep, and 18,370 swine. Capital, Elkton. II. A central county of Minnesota,

watered by Long Prairie and Partridge rivers and other streams; area, 960 sq. m.; pop. in 1870, 2,036. The surface is generally level, interspersed with numerous small lakes, and the soil is productive. The Northern Pacific railroad passes through the N. part. The chief productions in 1870 were 15,907 bushels of wheat, 18,012 of oats, 13,736 of potatoes, 25,683 lbs. of butter, and 3,389 tons of hay. There were 74 horses, 387 milch cows, and 613 other cattle. Capital, Long Prairie. **III.** A S. E. county of Dakota, bordering on Nebraska, and lying between the Missouri and Niobrara rivers; area, about 550 sq. m.; pop. in 1870, 337. The river bottoms are very fertile; the uplands consist of prairies. Capital, Fort Randall.

**TODD, Henry John**, an English clergyman, born in 1763, died at Settrington, Yorkshire, Dec. 24, 1845. He was educated at Oxford, and was vicar of Milton near Canterbury, rector of Allhallows, London, keeper of the manuscripts at Lambeth palace (1803), rector of Settrington (1820), prebendary of York (1830), and archdeacon of Cleveland (1832). His publications comprise "Illustrations of the Lives and Writings of Geoffrey Chaucer and John Gower" (8vo, 1810); an edition of Johnson's "Dictionary," with corrections and additions (4 vols. 4to, 1814); "Memoirs of the Life and Writings of Brian Walton" (2 vols. 8vo, 1821); "A Letter to the Archbishop of Canterbury, concerning the Authorship of Icon Basilikē" (8vo, 1825); "Some Account of the Life and Writings of John Milton" (8vo, 1826); and a life of Archbishop Cranmer (2 vols. 8vo, 1831).

**TODD, James Hawthorne**, an Irish antiquary, born in Dublin, April 23, 1806, died near there, June 28, 1869. He graduated at Trinity college, became a fellow there in 1831, and was regius professor of Hebrew in the university of Dublin. He was also treasurer and precentor of St. Patrick's cathedral, president of the royal Irish academy, and one of the founders of the Irish archaeological society. He edited several rare Irish manuscripts and tracts, including "The Wars of the Danes in Ireland," and published "Historical Tablets and Medallions" (1828); "Discourses on the Prophecies relating to Antichrist" (1840); "Historical Memoirs of the Successors of St. Patrick and Archbishops of Armagh" (2 vols. 8vo, 1861); and "St. Patrick, Apostle of Ireland" (1863). He collected a library of manuscripts, which after his death brought extraordinary prices.

**TODD, John**, an American clergyman, born in Rutland, Vt., Oct. 9, 1800, died in Pittsfield, Mass., Aug. 24, 1873. He graduated at Yale college in 1822, spent four years at the Andover theological seminary, and was ordained to the ministry in the Congregational church at Groton in 1827. In 1833 he was settled over the Edwards church at Northampton, in 1836 was called to the pastorate of the first Congregational church in Philadelphia, and from 1842 to 1872 was pastor of the first Congregational church in Pittsfield, Mass. He was one of the

founders of Mount Holyoke female seminary, and for several years was president of the trustees of the young ladies' institute of Pittsfield. In 1845 he received the degree of D. D. from Williams college. His principal works, most of which have passed through many editions both in the United States and England, and several translated into other languages, are: "Lectures to Children" (2 vols. 16mo, Northampton, 1834; 2d series, 1858); "Student's Manual" (12mo, 1835); "Index Rerum," prepared for noting books read (4to, 1835); "Truth made Simple" (18mo, 1839); "Great Cities, their Moral Influence" (18mo, 1841); "Lost Sister of Wyoming" (18mo, 1841); "The Young Man" (18mo, 1843); "Simple Sketches" (2 vols. 16mo, Pittsfield, 1843); "Pastor's Daughter" (24mo, 1844); "Stories on the Shorter Catechism" (2 vols. 18mo, Northampton, 1850-'51); "Summer Gleanings" (12mo, 1852); "The Daughter at School" (12mo, 1854); "The Angel of the Iceberg, and other Stories" (18mo, 1859); "Future Punishment" (32mo, New York, 1868); "Mountain Gems" (4 vols. 16mo, Boston, 1864); "Nuts for Boys to Crack" (16mo, New York, 1866; 8vo, 1868); "Polished Diamonds" (16mo, Boston, 1866); "Serpents in the Dove's Nest" (18mo, 1867); "Woman's Rights" (18mo, New York, 1868); "The Water Dove, and other Gems" (18mo, Edinburgh, 1868); "Mountain Flowers" (16mo, Northampton, 1869); "Sunset Land, or the Great Pacific Slope" (Boston, 1869); and "Old-Fashioned Lives" (1870). Several collective editions of his works were published from 1858 to 1868.—See "John Todd, the Story of his Life, told mainly by Himself, compiled and edited by Rev. John E. Todd" (16mo, New York, 1876).

**TODD, Robert Bentley**, a British physiologist, born in Dublin in 1809, died in London, Jan. 30, 1860. He was educated in Trinity college, Dublin, went to London in 1831, became professor of physiology and anatomy in King's college in 1837, and was also professor of clinical medicine in King's college hospital. He had great reputation as a practitioner, and published "Cyclopædia of Anatomy and Physiology" (4 vols. 8vo); "The Physiological Anatomy and Physiology of Man" (2 vols. 8vo), in conjunction with Dr. Bowman; "Anatomy of the Brain, Spinal Cord," &c.; "Lectures on Paralysis and Brain Diseases;" and "Treatise on Gout and Rheumatism."

**TODDY TREE.** See PALM, vol. xiii., p. 18.

**TODHUNTER, Isaac**, an English mathematician, born in Rye in 1820. He graduated at Cambridge in 1848, and became mathematical lecturer at St. John's college. He has published a series of works on higher mathematics for college instruction, which enjoy great favor in England. The most important of his works on the philosophy and history of mathematics are the "History of the Progress of the Calculus of Variations during the 19th Century"

(1861), "Researches on the Calculus of Variations" (1872), and "History of the Mathematical Theories of Attraction and the Figure of the Earth, from the Time of Newton to that of Laplace" (2 vols., 1878).

**TODLEBEN**, *Franz Edvard*, a Russian military engineer, born in Mitau, Courland, May 20, 1818. He was educated at the school of engineers in St. Petersburg, and after being employed in that department he served in the Caucasus against Shamyl from 1848 to 1851, and against the Turks on the Danube in 1853-'4. He displayed great genius in the defence of Sebastopol, and was wounded, June 20, 1855. Subsequently he was employed in strengthening Nikolayev and Cronstadt. In 1860 he became chief of engineering in the war office, with the rank of general, and he is at the same time the adjunct of the grand duke Nicholas in the general direction of this service. His history of the defence of Sebastopol (St. Petersburg, 1864) has been translated into several languages, and reviewed in a volume by William Howard Russell (London, 1864).

**TOFANA**. See *AQUA TOFANA*.

**TOKRUL BEG**. See *SERLJUKS*.

**TOKAT**, or *Tocat*, a town of Asiatic Turkey, in the vilayet and 55 m. N. N. W. of the city of Sivas, on the Yeshil Irmak (the ancient Iris); pop. estimated variously from 45,000 to 150,000. It has high limestone hills on three sides, and is commanded by two peaks which are almost perpendicular and consist of crystalline marble. The houses are of mud or unburned bricks, but the town has a large and handsome Armenian church and several mosques. The manufactures consist chiefly of copper articles and hardware, woollen, linen, silk, cotton goods, and carpets; and there are dyeing and calico-printing establishments. The inhabitants are chiefly Turks.

**TOKAY** (Hun. *Tokaj*), a town of N. Hungary, in the county of Zemplén, at the junction of the rivers Bodrog and Theiss, 117 m. E. N. E. of Pesth; pop. in 1870, 5,012. Several important fairs are held here annually. Tokay is celebrated for the wine produced in its vicinity. (See *HUNGARY, WINES OF*.)

**TOKIO** (formerly *Yedo*), a city and the capital of Japan, in the E. part of the main island, at the head of the bay of Yedo, on the Sumidagawa, in lat. 35° 40' N., lon. 139° 40' E.; pop. in 1872, 779,361, including a garrison of 7,140 and 400 foreigners. The city is a combination of compactly built and densely inhabited districts, with intervening gardens and groves devoted to civil and religious uses, the whole covering nearly 60 sq. m., the area of the built up portion being about 28 sq. m., while one eighth of the whole is occupied by moats and canals. The centre of the city is the citadel, surrounded by stone walls and a moat, outside of which a second wall encloses about 8 sq. m. A third system of walls and moats encloses about 5 sq. m., formerly occupied by the residences of the daimios, but now

covered with government buildings, colleges, schools, arsenals, barracks, founderies, steam mills, and factories. Outside, in the business and more densely populated portion, are miles of brick and stone buildings in the European style of architecture, and the shops are filled with foreign wares. The streets are wide, regular, and clean. The city is abundantly supplied with water brought in wooden aqueducts from the Tonegawa, 9 m. distant, and a part of it is lighted with gas. For police purposes it is divided into 6 principal and 96 smaller districts, with stations connected by telegraph and a uniformed force of 3,500 men. At the N. and S. ends of the city are the cemeteries, filled with tombs and temples. There are 741 Shinto shrines, 2,179 Buddhist temples, and 4 Christian churches. The imperial university has in its different faculties nearly 100 foreign instructors. The language, normal, and elementary schools are attended by more than 60,000 pupils. There are several banks, and more than a dozen daily newspapers printed with metal type on improved presses, and native capital has established cotton, woollen, and paper mills driven by steam, while sewing, knitting, and other manual machines are very common. Hundreds of horse vehicles and over 20,000 *jin-riki-sha* (man-power carriages) make the streets lively. Places of amusement abound; actors, wrestlers, story tellers, and female minstrels are numerous. Foreign dress and manner of living have been largely adopted, and the place presents most of the characteristics of a modern European or American city. It is connected by telegraph with Nagasaki, Hakodadi, and other cities. There is a railway to Yokohama, 18 m. distant, and a line has been surveyed to Kioto, 235 m. The shallow bay permits only junks and small steamboats to reach the city, and the foreign trade is limited.—Yedo was laid out in 1591, when the walls of the present stronghold were built, and it soon became the military centre of the empire. In 1656 and 1854 earthquakes occasioned an immense loss of life and property; and there have been many very destructive conflagrations, owing to the former combustible style of building and inefficient police. In 1861 the British and French legations were established here, but were soon driven away, and were not reestablished till 1865. It 1862 it ceased to be the compulsory residence of the daimios. In 1868 it became the residence of the mikado, and the name was changed to Tokio ("eastern capital"). On Jan. 1, 1869, the port was formally opened to foreign trade and residence. In the summer of 1871 the entire power of the empire was centred here.

**TÖKÖLYI**, or *Tököl*, *Imre*. See *HUNGARY*, vol. ix., p. 58.

**TOLAND**, *John*, a British author, born near Londonderry, Ireland, in 1669 or 1670, died at Putney, near London, March 11, 1722. He studied three years at the University of Glas-

gow, received the degree of M. A. at the university of Edinburgh in 1690, studied two years for the ministry at Leyden, and finally became a conspicuous free thinker at Oxford. He went to Dublin in 1697, where the Irish parliament ordered the common hangman to burn his "Christianity not Mysteries" (London, 1696), and returning to London published "An Apology for Mr. Toland" (1697). He visited the courts of Hanover and Berlin, apparently as a political agent, and held a theological discussion with Beausobre. On returning to England, he professed himself in 1702 "a true Christian" and "a good churchman," but in 1705 declared himself a pantheist. He wrote political pamphlets for the earl of Oxford (Harley), by whom he was sent again in 1707 to Germany and Holland, as a political spy. Returning after three years, he was supported by Harley till a quarrel separated them. His other publications include "The Militia Reformed, or an Easy Scheme of Furnishing England with a constant Land Force" (1698); a "Life of Milton" (1698); editions of Lord Holles's "Memoirs" and of Harrington's "Works;" "Anglia Libera" (1701), a treatise on the succession of the crown of England; and "Nazarenus, or Jewish Gentile, or Mahometan Christianity, containing the History of the Ancient Gospel of Barnabas, and the Modern Gospel of the Mahometans, attributed to the same Apostle, this last Gospel being now first made known among Christians," &c., which involved him in controversies. His posthumous works were published with a biography by Des Maizeaux (2 vols., 1726; new ed., 1747).

**TOLEDO.** I. A central province of Spain, in New Castile, bordering on Ávila, Madrid, Cuenca, Ciudad Real, and Cáceres; area, 5,586 sq. m.; pop. in 1870, 342,272. The surface is generally mountainous, and there are elevated plains near the centre. The Tagus flows W. through the middle of the province. The Jigüela and its affluents flow toward the Guadiana. Gold, silver, lead, iron, copper, quicksilver, tin, cinnabar, alum, bismuth, coal, graphite, and ochre are found. The soil is generally poor, but in the centre and toward the south the quality improves. Grain, flax, fruit, vegetables, wine, oil, and silk are produced. But very few sheep, cattle, or horses are reared. II. A city (anc. *Toletum*), capital of the province, on the Tagus, 42 m. S. S. W. of Madrid; pop. about 18,000. It stands on a rocky height, around which

the river in horseshoe shape flows in a deep and narrow channel, crossed by two stone bridges 100 ft. in height, one of which, built by the Moors, consists of a single arch. The town is encircled by two walls, originally Roman, but repaired and extended by Goths, Moors, and Spaniards, and entered by nine gates. The streets are steep, crooked, and narrow. The houses are generally in the Moorish style, from two to four stories high, with the apartments arranged round a court. The cathedral, in pure Gothic and with a lofty spire, founded in 1258 and completed in 1492, is one of the finest in Spain. The palace of the archbishop (who is the primate of Spain) formerly contained a rich collection of books and manuscripts, now added to the provincial library, which has 70,000 volumes. The foundling hospital of Santa Cruz, a fine piece of architecture, was founded by Cardinal Mendoza in 1494. The dilapidated walls of the ancient Alcázar are still standing. The university was suppressed in 1845; a seminary for theological students has been founded to supply its place; and there is a military school, a female college, school of fine arts, and other public schools. The principal manufactures are woollen and silk goods, oil, leather, and the celebrated Toledo blades, made in the royal sword manufactory two miles from the town. There is also a royal foundery outside the walls.—According to an ancient but improbable tradition, Toledo was founded by Jewish colonists in the 6th century B. C. It was taken by the Romans in 192 B. C., and by the Goths in A. D. 467, who made it the capital of their kingdom a century later. It was captured by the Moors in 714, and wrested from them

The Alcázar of Toledo.

by Alfonso VI. of Castile and Leon after a terrible siege in 1085, when it became the capital of Castile, and at one time had a population of 200,000. It afterward suffered many

sieges, and the removal of the court to Madrid in 1560 led to its decline. It was occupied by the French from 1808 to 1818.

**TOLEDO**, a city and the capital of Lucas co., Ohio, port of entry of the district of Miami, on the Maumee river, 5 m. from its mouth in Maumee bay and 8 m. from the W. extremity of Lake Erie, 92 m. W. of Cleveland, and 53 m. S. S. W. of Detroit, Mich.; pop. in 1850, 3,829; in 1860, 13,768; in 1870, 31,584, of whom 11,099 were foreigners, including 5,341 Germans and 3,031 Irish; in 1875, estimated at 50,000. It comprises an area of 21.5 sq. m., of which 9.63 sq. m. were annexed in 1874; 6.2 sq. m. are on the E. side of the river and 15.3 sq. m. on the W. side. It has a fine harbor, and is well laid out, having wide streets that give an easy ascent from the harbor to the table land on which most of the houses are built. It has large and handsome public buildings, several small parks, street railroads, and water works recently erected. The number of miles of improved streets at the beginning of 1875 was 35.06; of sewers, 26.945; of water pipe, 41.62. Toledo communicates by the Miami and Erie canal with Cincinnati and Evansville, Ind., and has extensive railroad connections. The lines centring here are the Lake Shore and Michigan Southern, Toledo, Wabash, and Western, Dayton and Michigan, Detroit and Toledo, Flint and Pere Marquette, Canada Southern, Columbus and Toledo, Toledo and Maumee, Toledo and Sylvania, and Toledo, Tiffin, and Eastern. All these railroads concentrate at an immense union depot. The chief items of receipt and shipment are grain and flour. There are 10 grain elevators, with a storage capacity of 4,017,000 bushels, and capacity to receive and ship 780,000 bushels daily. The aggregate deliveries of grain, including flour, for 14 years have been as follows:

YEARS.	Bushels.	YEARS.	Bushels.
1861.....	18,598,565	1868.....	16,141,990
1862.....	21,518,068	1869.....	18,580,949
1863.....	14,926,459	1870.....	22,714,510
1864.....	14,108,993	1871.....	33,300,220
1865.....	12,857,340	1872.....	35,527,285
1866.....	11,595,835	1873.....	34,349,577
1867.....	18,181,905	1874.....	39,304,891

The receipts in 1874 were 730,768 barrels of flour, 10,107,382 bushels of wheat, 17,031,996 of Indian corn, 6,460,247 of oats, 14,105 of rye, and 190,224 of barley. The shipments were 879,268 barrels of flour, 8,342,069 bushels of wheat, 16,801,345 of Indian corn, 6,381,372 of oats, 13,896 of rye, and 24,030 of barley. Other important items of receipt are provisions, live stock, whiskey, iron, tobacco, hides, cotton, wool, and lumber. In 1874 there were manufactured in the city 237,000 barrels of flour, 10,000,000 laths, and 30,000,000 ft. of lumber. The value of imports from Canada during the year ending June 30, 1874, was \$79,018; of exports to Canada, \$1,836,825;

number of entrances, 802 of 69,517 tons; clearances, 286 of 71,389 tons; entrances in the coastwise trade, 1,962 of 441,593 tons; clearances, 1,918 of 425,951 tons; number of vessels belonging in the district, 170, with an aggregate tonnage of 13,946. The manufactories of Toledo include 5 flouring mills, 5 lumber mills, 6 iron foundries, a blast furnace, 5 breweries, 7 brick yards, 14 planing mills, 4 ship yards, 5 tanning and currying establishments, 2 manufactories of cars, 1 of car wheels, several of carriages and wagons, 2 of chairs, 1 of edge tools, 2 of files, 4 of lime, 1 of mowers and reapers, 3 of potash, 1 of refrigerators, 2 of coffee and spice mills, 3 of staves, 1 of stoves, 3 of tobacco, 2 of wire goods, 1 of wooden ware, and 2 of boots and shoes. There are six banks, with an aggregate capital of \$1,900,000; three savings banks and several savings and loan associations, three fire and marine insurance companies, and one life insurance company.—The city is divided into eight wards, and is governed by a mayor, eight aldermen, and 16 councilmen. The principal charitable institutions are the city hospital, house of refuge and correction, home for friendless women, and three orphan asylums. There are 20 ward school houses and a high school building, with 122 teachers and about 7,500 pupils enrolled in 1874-'5, and 10 denominational and private schools. The public library contains 8,000 volumes. Three daily (one German), two tri-weekly, one semi-weekly, and six weekly (one German) newspapers, and six monthly periodicals are published. There are 45 churches, viz.: 3 Baptist, 1 Christian, 3 Congregational, 4 Episcopal, 2 Evangelical Association (German), 2 Evangelical Lutheran (German), 1 Evangelical Reformed (German), 2 Jewish, 3 Lutheran (German), 8 Methodist (2 German), 4 Presbyterian (1 German), 8 Roman Catholic (2 French and 2 German), 1 seamen's Bethel, 1 Swedenborgian, 1 Unitarian, and 1 United Brethren.—Toledo was settled in 1832, and incorporated in 1836.

**TOLLAND**, a N. E. county of Connecticut, bordering on Massachusetts, drained by the Willimantic and Hop rivers; area, 440 sq. m.; pop. in 1870, 22,000. In the W. part the surface is nearly level and the soil fertile, but in the E. part it is very hilly and the soil inferior. It is intersected by the Hartford, Providence, and Fishkill, and Rockville branch, and the New London Northern railroads. The chief productions in 1870 were 15,860 bushels of rye, 101,721 of Indian corn, 76,574 of oats, 17,123 of buckwheat, 180,403 of potatoes, 531,399 lbs. of tobacco, 21,530 of wool, 386,763 of butter, 80,671 of cheese, and 40,320 tons of hay. There were 2,401 horses, 6,452 milch cows, 3,436 working oxen, 6,244 other cattle, 7,902 sheep, and 3,851 swine; 1 manufactory of leather belting and hose, 3 of boots and shoes, 5 of boxes, 12 of carriages and wagons, 23 of cotton goods, 2 of hosiery, 3 of iron castings, 8 of machinery, 9 of shoddy, 14 of silk goods,

24 of woollens, 2 bleaching and dyeing establishments, and 8 flour mills. Capital, Tolland.

**TOLLENS**, Hendrik Corneliszoon, a Dutch poet, born in Rotterdam, Sept. 24, 1780, died in Ryswick, Oct. 21, 1856. He was intended for trade, but in 1800 began publishing poetry, and finally became one of the most celebrated national bards. His masterpieces include a narrative poem on Barentz's expedition to Nova Zembla (new ed., 1844), dramatic works, and patriotic lyrics, especially the *Wapenkreet* (1815). His *Gezamentlijke dichtwerken* comprise 8 vols. (Leeuwarden, 1855-'7).

**TOLNA**, a S. W. county of Hungary, bordering on the counties of Veszprém, Stuhlweisensburg, Pesth, Baranya, and Somogy; area, 1,407 sq. m.; pop. in 1870, 220,740. It is watered by the Danube, which forms its E. frontier, and by the Sárviz and Kapos. The soil is generally fertile, except the sandy E. portion. Corn, tobacco, flax, wine, and fruit are produced, and cattle, pigs, sheep, and horses abound. Capital, Szegszárd.

**TOLSTOI**, a Russian family, celebrated since the 17th century. Among its best known members at the present day are Count Alexis Tolstoi (born Sept. 5, 1817, died Oct. 10, 1875), a poet, novelist, and dramatist, author of three historical tragedies forming a trilogy, "Death of Ivan the Terrible," "Czar Feodor," and "Czar Boris," and Count Leo Tolstoi, whose novel of *Anna Karenina* (1875-'6) has given him a great reputation.

**TOLTECS**, or *Tlhuatecas*, a nation of Mexico, who according to Mexican annals appeared in Anahuac in the beginning of the 7th century, led in their wanderings from another continent or country by Tanub. They founded the kingdom of Tula, and were the first civilized and civilizing race. As they increased, capital arose at Colhuacan, Otompan, and Tollan. The Chichimecs, a nation of different origin, entered the country about a century later, and these were followed in time by seven Nahuatl tribes, of the same race as the Toltecs, the Mexicans being the last. Before this the Toltec monarchy, rent by civil wars between the clergy and nobles, had fallen in the 11th century; famine and pestilence desolated the country, and many of the survivors emigrated to Guatemala. The rest of the Toltecs were incorporated by the Chichimecs, to whom they imparted their civilization. The emigrants founded in Guatemala a new empire, and the Quichés claimed descent from them, though the names of the later Quiché monarchs show another language than the Toltec. It is usual to refer all that is grand or surprising in Mexico and adjoining parts to the Toltecs; but tradition ascribes to them definitely the use of hieroglyphics, astronomical knowledge and the division of time, agriculture, weaving, stone cutting, and architecture.

**TOLU**, *Balsam of*. See **BALSAMS**.

**TOLUCA**, a city of the republic, capital of the state, and 80 m. W. S. W. of the city of Mexi-

co; pop. about 12,000. It is in a valley about 8,800 ft. above the sea, and has spacious, well paved streets, a public square, and several fine churches. Of late years its trade and industry have much declined. Near the town is the volcanic mountain of the same name, which rises to the height of 16,610 ft. above the sea.

**TOMATO**, a plant of the *solanaceæ* or nightshade family, cultivated for its fruit. It is a native of tropical or sub-tropical America, and its name, given in the earlier works as *tumati* and *tomati*, is of Indian origin. The plant was originally placed in the genus *lycopersicum*, which Linnæus reduced to *solanum*; but later botanists, thinking that the difference in the anthers, which are united at the tips and open by a longitudinal slit, and not by a pore at the apex as in *solanum*, was a sufficient distinction, restored the genus, and call the tomato *lycopersicum esculentum*; while some still adhere to the view of Linnæus, and class the plant as *solanum lycopersicum*. The older English writers call the fruit love apple; in France *pomme d'amour*, and in Italy *pomi d'amore*, are still in use, perpetuating the old notion that their use as food had an influence upon the passions. Peru is regarded as its native country, but it has not been found there or elsewhere in a truly wild state, and it had probably been long in cultivation before the advent of the Europeans. The tomato has weak stems about 4 ft. long, and when left to itself forms a much branched trailing or prostrate plant. Its leaves are irregularly pinnate, with the larger leaflets themselves cut or divided; both stem and leaves are clothed with soft viscid hairs, which exude a strong-smelling, rather fetid, and somewhat resinous sub-

Varieties of the Tomato.—1. Common Red. 2. The "Trophy." 3. Pear-shaped. 4. Currant Tomato.

stance, which stains the hands and clothing when the plants are handled. It has been lately said that an infusion of tomato leaves is effective in destroying plant lice. The flower stalks, or peduncles, are extra-axillary and bear

racemose clusters of yellow flowers, which, with the exception in the anthers already noted, have a similar structure to those of the solanums. (See SOLANUM.) The fruit is normally a two- or three-celled berry, but in the cultivated plant there are usually numerous cells; the fruit, especially in the larger specimens, often has a very complicated structure, resulting from the union of two or more flowers; their pistils being fused together present at maturity a curiously abnormal fruit, in which all traces of the original structure are lost. The cultivated tomatoes present a great variety in form, color, and size, and it is not known whether they are from several species or are different forms of one very variable species. The plant is remarkably plastic, and by selecting seeds from fruit with desirable peculiarities, it is very easy to establish a strain or variety. When tomatoes were first cultivated in our gardens there was but one variety; this had a

Tree-formed Tomato.

large, red, much wrinkled, and often irregular and misshapen fruit, with a thick outer wall, and a central placenta bearing the seeds surrounded by their pulp, and a considerable cavity or empty space between the two. By selection this was improved as to its surface, and greater solidity acquired, and the strain known as the smooth red was obtained, which is still one of the best. The variety known as the "Trophy" probably combines more good qualities than any other; it has very large and smooth fruit, which is solid throughout, and of the best possible quality; this is the result of 20 years' careful selection by an intelligent grower, with a definite end in view. Many attempts have been made to increase the earliness of the fruit, but improvement in this direction is limited by the law that every plant needs a certain aggregate amount of heat to bring it to maturity; the varieties "Conqueror" and "Canada Victor" have apparently reached this limit. Among the very

distinct varieties is the "Feejee," which has a large rose or pinkish red fruit; there are several yellow varieties and one nearly white large one, and there are both yellow and red of smaller sorts named according to the shape and size of the fruit, such as the pear, plum, and cherry tomatoes; the currant tomato, which has berries scarcely larger than a large currant, in long racemes, and delicate foliage, is very ornamental, and apparently a distinct species, probably *L. cerasiforme*. The upright or tree tomato originated in France; its main stem is thick, and its few branches so short and strong that it carries its weight of large fruit without support; but it is not very productive. Less than half a century ago the tomato was almost unknown to northern gardens, or cultivated in them only as a curiosity, but at present it is one of the most popular of vegetables. As the fruit will color and ripen when picked green, it can be transported to great distances, if properly packed in small crates with abundant openings for ventilation; the first tomatoes in the northern markets come from Bermuda, appearing in February, followed successively by contributions from Florida, Georgia, &c., before the fruit from the gardens near by is ripe. At the north the seeds are sown in hot-beds, the young plants set out in other hot-beds, and finally transplanted to cold frames, where they may be protected at night until the weather is warm enough to set them in the open ground. Light, well manured soils are better than heavy ones for this crop; in field culture the plants soon fall over with the weight of fruit and are allowed to lie upon the ground, but in private gardens they are supported by a frame or trellis, or tacked up to a fence or the side of a building; by proper pruning and removing the excess of young fruit, the size and quality of that allowed to ripen is greatly improved.—The tomato is used in a great variety of ways, being eaten raw as a salad, stewed, baked, broiled, and as an ingredient of soups, stews, and sauces; it is used to make a popular catsup, and is pickled and preserved in various ways.—The strawberry tomato is described under *PHYSALIS*.

**TOMBIGBEE**, *Tombigby*, or *Tombuckbee*, a river of Mississippi and Alabama, which rises in Tishomingo co. in the N. E. extremity of the former state. It first flows S. to Columbus, thence S. E. to Demopolis, Ala., where it receives the Black Warrior on the left, and thence generally S., with many and sudden windings, to its junction with the Alabama, about 45 m. from Mobile, where the united stream takes the name of Mobile river, and falls into Mobile bay about 30 m. from the gulf of Mexico. Its length is estimated at 450 m., and it is navigable for large steamboats to Columbus, 366 m. from the mouth of Mobile river.

**TOM GREEN**, a S. W. county of Texas, formed in 1874; area, about 14,000 sq. m. It is bounded S. W. by the Pecos river and N. W. by New Mexico. In the east it is intersect-

ed by the head streams of the Colorado river. This county, with Crockett, formed in 1875, has absorbed what was formerly known as Bexar district or territory. Capital, Ben Ficklin.

**TOMLINE, George**, an English prelate, eldest son of George Pretyma, born in Bury St. Edmunds, Oct. 9, 1750, died in Winchester, Nov. 14, 1827. He was educated at Cambridge, and in 1778 became tutor to William Pitt, who made him his private secretary on becoming chancellor of the exchequer in 1782, and his secretary when he became first lord of the treasury. Pretyma remained with Pitt till 1787, when he was made bishop of Lincoln and dean of St. Paul's. In 1820 he was transferred to the see of Winchester. In 1808 he received by will an estate from Marmaduke Tomline, and assumed that name. He published "The Elements of Christian Theology" (2 vols. 8vo, 1799), which has passed through numerous editions; "A Refutation of Calvinism" (1811); and "Memoirs of William Pitt" (8 vols. 8vo, 1821), "which," Macaulay says, "enjoys the distinction of being the worst biographical work of its size in the world."

**TOMMASEO, Niccolò**, an Italian author, born in Sebenico, Dalmatia, about 1808, died in Florence, May 1, 1874. He resided several years in Florence, wrote for the patriotic *Antologia*, went as an exile to France in 1833, and in 1838 settled in Venice. He was arrested with Manin in January, 1848, but they were rescued in March by the people, and in August Tommaseo became minister of religion and education in the revolutionary government, and vainly attempted to procure French intervention in favor of the republic. After the restoration of Austrian rule in August, 1849, he was banished from Venice, resided in Corfu and Turin, and in 1865 finally returned to Florence. His works include *Nuovo dizionario dei sinonimi della lingua italiana* (Florence, 1832; 5th ed., 2 vols., Milan, 1867); *Canti popolari* (2 vols., Venice, 1843); *Studi critici* (2 vols., 1843); *Lettere di Pasquale de' Paoli*, with Paoli's biography and a history of the war for Corsican independence (Florence, 1846); *Nuovi studi su Dante* (Turin, 1865); and *Poesie* (1872).

**TOMONI IWAKURA**, a Japanese statesman, born in Kioto about 1825. He is a *kuge* or court noble of the Murakami branch of the Minamoto family, and was a leader as well as the instrument of the conspiracy which effected the Kioto *coup d'état* of Jan. 3, 1868, overthrowing the shogunate, and establishing a government in which his class held the chief offices. (See JAPAN, vol. ix., p. 546.) In August, 1871, he was made minister of foreign affairs, and was active in the abolition of the feudal system and the retirement of the ex-daimios to private life. In December he left Japan as chief of the embassy which visited the United States and the principal capitals of Europe. On his return in September, 1873, he was made junior prime minister, which office he now holds (1876). He was active in

averting the threatened war with Corea in 1878. He has been especially distinguished for his advocacy of the introduction of the forms and improvements of western civilization, and he sent his sons to the United States to be educated. On the night of Jan. 14, 1874, while he was in his carriage near the mikado's palace, an attempt was made to assassinate him, but he escaped with several severe wounds.

**TOMPKINS**, a central county of New York, drained by several tributaries of Cayuga lake, the head of which lies in the N. part, and traversed by several railroads; area, 506 sq. m.; pop. in 1875, 32,916. The surface is hilly, the valley of the lake being 700 ft. below the ridges on either side, and the soil is generally best adapted to grazing. Cayuga lake supplies water communication with the Erie canal. The chief productions in 1870 were 291,194 bushels of wheat, 422,411 of Indian corn, 737,741 of oats, 286,183 of barley, 148,917 of buckwheat, 273,941 of potatoes, 63,681 lbs. of tobacco, 169,867 of wool, 62,390 of flax, 1,884,029 of butter, and 70,907 tons of hay. There were 8,804 horses, 16,402 milch cows, 11,869 other cattle, 85,872 sheep, and 7,462 swine; 11 manufacturing of agricultural implements, 24 of carriages and wagons, 1 of cars, 7 of cheese, 1 of clocks, 12 of furniture, 3 of hubs and wagon material, 7 of iron castings, 4 of machinery, 1 of organs, 2 of printing paper, 6 of tobacco and cigars, 4 of woollens, 26 flour mills, 19 saw mills, 8 tanneries, and 5 currying establishments. Capital, Ithaca.

**TOMPKINS, Daniel D.**, an American statesman, born at Scarsdale, Westchester co., N. Y., June 21, 1774, died on Staten island, June 11, 1825. He graduated at Columbia college in 1795, was admitted to the bar in New York in 1797, and in 1801 was a member of the legislature, and of the convention for revising the state constitution. In 1804 he was elected to congress from the city of New York, but resigned to become one of the associate justices of the supreme court of the state. From 1807 to 1817 he was governor of New York, and he was conspicuous for his support of the national government during the war of 1812. In 1812 he prorogued the legislature for ten months, to prevent the establishment of the bank of America in the city of New York. This measure gave him temporary popularity, but did not defeat the charter of the bank, which was passed in 1813. In a special message to the legislature, Jan. 28, 1817, he recommended the abolition of slavery in the state of New York; and an act for that purpose was accordingly passed, to take effect July 4, 1827. In 1816 he was elected vice president of the United States, and in 1817 resigned the governorship on assuming that office, to which he was reelected in 1820, retiring March 4, 1825.

**TOMSK.** I. A government of western Siberia, bordering on Tobolsk, Yeniseisk, China, and the Central Asian provinces of Semipolatsk and Akmolinsk, from which it is partly sepa-

rated by the Irtysh; area, 329,027 sq. m.; pop. in 1870, 888,756. The Altai mountains extend along the S. part. The river Obi rises in the south, flows N., and receives numerous tributaries, the chief of which are the Tchumish, Tom, Tchulim, and Ket. There are several lakes. Gold, silver, copper, lead, and iron are extensively worked in the south. The N. part is barren, but toward the south the pastures become luxuriant, and abundant crops are raised; but cattle constitute the principal wealth. II. A city, capital of the government, on the right bank of the Tom, 620 m. E. S. E. of Tobolsk; pop. in 1867, 24,431. It consists of an upper town inhabited by the wealthy classes, chiefly Russians, and a lower town, by Tartars and Bokharians. It has many fine private and public buildings. In 1875 provisions were made for a Siberian university here. The chief trade is in grain, leather, and furs. Situated on the great road leading to the Chinese border, it is next to Irkutsk the most prosperous town of Siberia. It was founded about 1610.

**TON**, or **Tm**, a denomination of weight, equal to 20 cwt. or 2,240 lbs., and also (usually with the second orthography) a liquid measure of 252 gallons; also applied to dry measures and solid measures of various capacities in different countries. In common use, the ton weight is often rated at 2,000 lbs., when it is termed the "short ton;" but by act of congress, when not specified to the contrary, the ton is to be understood as 2,240 lbs. In Maryland the ordinary ton is 2,000 lbs., the usual coal ton 2,340 lbs., and the miner's ton, according to which he is paid, is 2,470 lbs., the allowance being for waste. The shipping ton of France was by the old standard 2,158.43 lbs., and the metrical ton is 2,204.6 lbs.; the shipping ton of Spain is 2,032.2 lbs.; of Portugal, 1,755.8 lbs. The measurement ton for shipping is in the United States 40 cubic ft. In England the tun for wine is 252 gallons.

**TOPE**, **Theobald Wolfe**, an Irish revolutionist, born in Dublin, June 20, 1763, died in prison there, Nov. 19, 1793. He graduated at Trinity college, Dublin, and was called to the bar in London in 1789. In defence of the whig club he published "A Review of the Last Session of Parliament" in pamphlet form, and on the appearance of a rupture with Spain wrote a pamphlet to prove that Ireland as an independent nation was not bound by a declaration of war. Subsequently he sought to effect a union against the government between the Catholics of Ireland and the dissenters, and in 1791 addressed to the latter "An Argument on behalf of the Catholics of Ireland." The same year he assisted in founding the first club of "United Irishmen" at Belfast, and others in other parts of Ireland. He became secretary and agent of the Catholic committee in 1792, and was subsequently implicated in the proceedings of Jackson, sent from France to sound the sentiments of the Irish. He was allowed

to retire from the country, and in 1795 came to the United States. Letters asserting that Ireland was ripe for a revolt induced him to sail for France in January, 1796, to gain the aid of the directory; and owing in large measure to his exertions, that government determined to fit out a powerful expedition under the command of Hoche. In July Tone received his commission as *chef de brigade*, and was also made an adjutant general to Hoche, whom he accompanied in December in the armament destined for Bantry bay. The fleet was scattered by storms, and the French government would not undertake another expedition. In 1797 Tone was attached to Moreau's army; and in September, 1798, he accompanied a petty squadron destined for Ireland, which was intercepted and defeated by an English squadron. After fighting desperately, Tone was captured, carried to Dublin, tried by court martial, and sentenced to be hanged on Nov. 12. He died, however by his own hand, having cut his throat with a penknife on the 11th. After his death appeared "The Life of Theobald Wolfe Tone, written by himself, with his Political Writings," &c., edited by his son William Theobald Wolfe Tone (including "An Account of his own Campaigns under Napoleon," 2 vols. 8vo, Washington, 1826; abridged, London, 1827, 1837, and 1847).—His son was an officer in the French army, and after the fall of Napoleon in that of the United States; and he was also the author of *L'État civil et politique de l'Italie sous la domination des Goths* (Paris, 1818), and "School of Cavalry" (Georgetown, D. C., 1838).

**TONGATABOO**. See FRIENDLY ISLANDS.

**TONGUE**, in the animal system, the organ, situated on the median line, at the commencement of the alimentary canal, ministering to the senses of touch and taste. Taking the tongue of man as an example, the organ is attached at its base to the movable hyoid arch of bones, and suspended and kept in place by muscles from the base of the skull, lower jaw, and hyoid bone; it is essentially composed of muscular fibres, which move freely its various portions; it is covered by sensitive mucous membrane, containing numerous mucous glands and follicles; fibrous, areolar, and fatty tissues enter into its structure, which is freely supplied with blood vessels and nerves. The size bears no relation to the height of the individual, but is proportioned to the capacity of the alveolar arch; it is, therefore, smaller in women than in men. From the base to the epiglottis extends a fold serving to limit the movements of the latter organ, and from the sides of the base to the soft palate two folds on each side, the pillars of the fauces, between which are the tonsils; under the anterior free extremity is the frenum, which connects it with the lower jaw, a fibrous and mucous lamina or ligament, sometimes so short congenitally as to prevent the free movements of the tongue and to require an operation for its division. There

is a more or less distinct longitudinal furrow on the median line, from which extend outward and forward numerous other lines whose angle of union points backward; the posterior third is smooth and without compound papillæ, exhibiting a few simple ones and the nodular eminences of the numerous muciparous glands; in front of this is a V-shaped ridge, the angle directed backward, formed by two converging lines of button-like eminences, the circumvallate papillæ; in front of these, and occupying the anterior two thirds of the organ, are the fungiform and conical or villiform papillæ, the former spheroidal and scattered, the latter very numerous. The osseous support of the tongue is the U-shaped or hyoid bone, consisting of a base or median body, two greater and two lesser cornua, and placed in the neck between the lower jaw and the thyroid cartilage; it is the homologue of a very complex apparatus in the lower vertebrates. The muscles constitute the chief bulk of the tongue; they are arranged in a complicated manner, so as to support each other, rendering the movements of the organ exceedingly varied and extensive; they are attached to the submucous fibrous tissue, which is firm and thick on the superior surface. The mucous membrane is invested with a delicate scaly epithelium, the superficial layer of which readily and constantly falls off. The papillæ are much like those of the skin, most being compound organs, in their nervous and vascular supply. The circumvallate papillæ are 6 to 10 in number, and sometimes  $\frac{1}{2}$  in. in diameter; the fungiform are  $\frac{1}{16}$  to  $\frac{1}{8}$  in. in diameter, and vary greatly in number, perhaps accounting for the well known diversity in the acuteness of the sense of taste in different individuals; the filiform are the most numerous, closely set like the pile of velvet, covering the anterior two thirds of the tongue, and the seat of what is called the fur; their epithelium frequently breaks up into hair-like processes, having their imbrications directed backward, which mark a physiological distinction between the circumvallate and fungiform papillæ and the filiform and conical ones. The conical papillæ are generally regarded as tactile, the fungiform and circumvallate as gustatory (acutely tactile), and the filiform as the homologues of the recurved spines of the tongue of the cats, and as principally concerned in regulating the movements of the food in order to bring it within the reach of the muscles of deglutition. The principal arteries of the tongue are the lingual branches of the external carotid; the sensory nerves are the lingual branch of the fifth pair or trifacial and the glossopharyngeal, distributed respectively to the anterior and posterior portions, and the motor nerve is the hypoglossal; for their functions see TASTE. The tongue in fishes is rudimentary, and not endowed with any great sensibility or motor power; in reptiles it varies greatly in length, size, and movability, being in some immovable or short and

thick, in some remarkable for slenderness and length (as in serpents), and in others for protractility (as in the chameleon and frog); in them it is usually an organ of prehension and not of sensation. The tongue in birds is also prehensile and not gustatory, and generally

FIG. 1.—Papillæ circumvallate of Man, in transverse and vertical section. A. Proper papillæ. B. Wall. a. Epithelium. c. Secondary papillæ. b, b. Nerves of the papillæ and of the wall. (Magnified about 10 diameters.)

provided at the base with numerous spines directed backward to prevent the return of food; though itself incapable of elongation, it may be remarkably protruded by the action of the muscles attached to the very long and movable hyoid bones. In some mammals, as the giraffe and ant-eater, it is capable of great elongation, and is an important organ of prehension; the recurved spines of the cats have been referred to, and constitute efficient instruments for cleaning flesh from bones and for combing their fur. In man the tongue keeps the food during mastication within the range of the teeth, collects it from all parts of the mouth preparatory to swallowing it, and is also concerned in the commencement of deglutition; and it is a principal organ of articulation. It is liable to inflammation, enlargement, atrophy, ulcerations, tumors, and malignant diseases. The fur in disease depends on a sodden and opaque condition of the epithelium of the filiform and conical papillæ, arising from an alteration of the mucus and

FIG. 2.—A. Fungiform Papilla, showing the secondary papillæ on its surface, and at a its epithelium covering them over. (Magnified 25 diameters.) B. The capillary loops of the simple papillæ of A, injected: a, artery; v, vein. The groove around the base of some of the fungiform papillæ is represented, as well as the capillary loops (c, c) of some neighboring simple papillæ. (Magnified 18 diameters.)

saliva of the mouth, the bright red color of the fungiform papillæ presenting a striking contrast; the amount, color, and arrangement of the fur are symptomatic of various morbid changes in the system, of interest to the physician, though there is great variety within the

limits of health. The papillary surface is healed and repaired with great readiness and perfection.

**TONQUA BEAN** (also written Tonquin, Tonga, and Tonka), an Asiatic name applied to a South American product, the seeds of *dipterix odorata*, a tree belonging to the *leguminosæ* or pulse family. The genus *dipterix* (Gr. *dis*, double, and *πτερόν*, a wing) comprises about eight species, all large trees of the forests of Brazil, Guiana, and neighboring countries, and belongs to a tribe of the family of which there are no representatives in northern localities; the trees have pinnate leaves and large panicles of flowers, which are succeeded by (what is very unusual in the family) a pod containing only a single seed. The Tonqua bean tree grows 60 to 90 ft. high, with a trunk sometimes 3 ft. in diameter; the indehiscent pods, about 2 in. long, are almond-shaped and very

Tonqua Bean (*Dipterix odorata*). Half of the one-seeded pod.

thick; the single seed is over an inch long, shaped somewhat like a large kidney bean; it has a wrinkled skin, which is shiny black. The odor, which is remarkably strong, resembles that of the melilot or sweet clover and the sweet-scented vernal grass (*anthoxanthum*), and is due to the same principle, coumarine, a concrete crystallizable, volatile, neutral substance, with the composition  $C_{11}H_8O_4$ , very soluble in alcohol and ether, and somewhat so in boiling water, from which it crystallizes on cooling; the beans are often frosted with crystals of this, which show very distinctly on their black surface. Formerly the beans were much used to scent snuff, and they are often called "snuff beans," a few of them being placed in a jar with the snuff, or a single one kept in the snuff box; they were also formerly used in smoking tobacco, but a much cheaper substitute is found in the "wild vanilla" (*liatris odoratissima*) of Florida. (See VANILLA.) The odor of the bean bears some resemblance to that of the true vanilla, and much of the extract of vanilla sold for flavoring ice cream and articles of cookery is adulterated with it, and in some of the cheaper flavoring extracts it is entirely substituted for that costly material; any one with a nice sense of smell can readily detect the least admixture. The wood of the Tonqua bean tree is remarkably close-grained, hard, and heavy, and, though redder, much resembles lignumvitæ, and in some parts of South America it is called by that name; it is valued

for fine cabinet work. Another species, *D. eboensis*, is the eboe tree, the fruit of which is without odor; its timber is hard and valuable.

**TONQUIN.** See ANAM.

**TONQUIN**, Gulf of, an arm of the China sea, having the Anamese province of Tonquin on the west, the Chinese province of Quang-tung on the north and east, and the island of Hainan on the southeast; length, nearly 800 m.; average width, 150 m. The Sangkoi or Tonquin river flows into it. It has numerous islands. The typhoons are very violent in the gulf.

**TONSILS**, or *Amygdalæ*, two glandular organs, of an almond shape, with the larger end upward, situated on each side of the fauces, between the anterior and posterior pillars of the soft palate, and easily brought into view by opening the mouth. They are composed of a collection of mucous follicles, which open through 12 or 15 orifices on the inner side of each tonsil. These follicles are lined with a continuation of the mucous membrane of the pharynx, and have a structure similar to that of Peyer's glands in the small intestine. They secrete mucoas which goes to make up the mixed mass of saliva, or to lubricate the fauces during the act of deglutition, the pressure of the food and the constriction of the pharynx forcing the contents from the organs. They are supplied with blood from the facial, inferior pharyngeal, and internal maxillary arteries, and with nerves from the fifth and glossopharyngeal. The veins terminate in the tonsillar plexus on the outer side of the tonsil. These organs vary in size in different individuals, being notably larger in persons of scrofulous constitution. They are liable to acute inflammation, involving great enlargement and suppuration; an affection called tonsillitis or cynanche tonsillaris, and popularly quinsy.

**TONSTALL.** See TUNSTALL.

**TONTINE**, a kind of life annuity originated by Lorenzo Tonti, a Neapolitan, who published his scheme and introduced it into France about the middle of the 17th century. The subscribers or their representatives were divided into 10 classes, and an annuity was apportioned to each class according to their age, the survivors deriving an increased annuity as their associates died, and the last survivor receiving the entire annuity of the class till the close of his life. The first association of this kind, called the "Royal Tontine," was founded under the administration of Cardinal Mazarin in 1653. The total sum paid in was 1,025,000 francs, in 10 classes of 102,500 francs each. The subscription was 300 francs, and every subscriber received the interest of his investment until the death of some member of the association increased the dividend to the rest, and after the death of the last subscriber it reverted to the state. This project was not successful, nor were two more subsequently proposed by Tonti. In 1689 Louis XIV. authorized another of 1,400,000 francs divided into 14 classes, according to age, from children of 5 years to

adults of 70. In 1726 the last survivor of the 13th and 14th classes was the widow of a poor surgeon who had invested 800 francs in two tontines, and who enjoyed at her death, at the age of 96, an income of 73,500 francs. Tontines were again resorted to by the French government in 1733 and 1734; but in 1763 they were interdicted as a measure of finance. In 1791 a tontine called the *caisse Lafarge*, on a more extended scale, was established under private management; but by a gross blunder or fraud, the interest promised was impossible, and the subscribers, whose united contributions amounted to 60,000,000 francs, never received even simple interest, and the entire capital was lost in the disasters of the time. In England tontines have been occasionally resorted to as a measure of finance, the last opened being in 1789, and a few private ones have been established. In 1871 the Alexandra park company in London proposed to organize an institution similar to the South Kensington museum by means of a tontine to cease June 30, 1886; but the scheme proved unsuccessful, and was abandoned in 1872. In the United States there have been private annuities of this kind. The New York tontine association was organized in 1790, with 208 shares valued at \$250 each. The tontine coffee house was built in Wall street, and about 1850 the property was leased for business purposes. The lease was to expire and the property to revert to the owners of the shares depending upon the last seven surviving lives. This contingency occurred in 1870, but proceedings for winding up the affairs of the association and the partition of the property are still pending (1876). Buildings have been erected in some other cities on the same plan.

**TONTY, Henry de**, an Italian explorer, died at Fort Louis, Mobile, in September, 1704. The son of Lorenzo Tonti, inventor of the tontine system of association, he entered the French army as a cadet, served in the navy, and lost a hand. He came to Canada with La Salle in 1678. Near the present site of Peoria on the Illinois river he assisted in building a fort in 1680, which La Salle left in his command. He attempted a white settlement in Arkansas. In 1685 he brought a force of western Indians to join in attacking the Senecas. Twice he went to meet La Salle at the mouth of the Mississippi, but without finding him. He descended a third time to meet Iberville, and remained in the gulf region. His memoir of La Salle's voyage, published in Margry's *Relations et mémoires*, has been translated into English under the title "Account of M. de la Salle's last Expedition and Discoveries in North America" (12mo, London, 1698; 8vo, New York, 1814; in French's "Historical Collections of Louisiana," vol. i., 1846).

**TOOLE**, a W. county of Utah, bordering on Nevada, and bounded N. E. by Great Salt lake; area, 8,320 sq. m.; pop. in 1870, 2,177. The greater portion is a barren desert. The

hilly portions contain some valuable arable and grazing land, and mines of gold, silver, copper, and lead. In the W. part are large fertile valleys and several mining districts. The chief productions in 1870 were 23,483 bushels of wheat, 2,505 of Indian corn, 2,840 of oats, 1,630 of barley, 9,848 of potatoes, 8,497 lbs. of wool, and 978 tons of hay. There were 511 horses, 2,041 cattle, 4,929 sheep, and 121 swine; 1 flour mill, and 2 saw mills. Capital, Tooele.

**TOOKE, John Horne**, an English politician, born in Westminster, June 25, 1786, died at Wimbledon, March 18, 1812. He was the son of John Horne, a poulterer, was educated at Cambridge, became an usher in a school at Blackheath, took orders, and obtained a curacy in Kent. He was ordained priest in 1760, and for three years officiated in the chapelry of New Brentford. He then went to France as travelling tutor to the son of Elwes the miser. In 1765 he wrote a pamphlet in favor of Wilkes and his party; and on a second visit to the continent he formed at Paris an intimate acquaintance with that politician. On his return in 1767 he took an active interest in political matters, especially in securing the election of Wilkes from Middlesex. In 1769 he was one of the founders of the society for supporting the bill of rights; but its financial affairs involved him in a quarrel with Wilkes, and for this he was attacked by Junius, but defended himself with success. In 1771 he received his degree of M. A. from the university of Cambridge. In 1773, designing to study law, he formally resigned his living. He rendered great assistance in resisting an enclosure bill which would have reduced the value of some property of his friend William Tooke of Purley, who in return made him his heir; but, though in 1782 he changed his name to Tooke, he never received more than £8,000 from the property. He bitterly opposed the American war, and advertised for a subscription for the widows and orphans of the Americans "murdered by the king's troops at Lexington and at Concord." The ministry prosecuted him for libel, and he was tried at Guildhall in July, 1777. He conducted his own defence, but was condemned to one year's imprisonment and a fine of £200. While confined he published his celebrated "Letter to Mr. Dunning," critically explaining the case of *The King v. Lawley*, which had been used as a precedent against him on his trial. He declared himself "the victim of two prepositions and a conjunction," which particles he calls "the abject instruments of his civil extinction." After his release in 1779, he applied for admission to the bar, but was rejected on the ground of being a clergyman. He published in 1780, in conjunction with Dr. Price, a pamphlet entitled "Facts," severely reflecting upon Lord North and his prosecution of the American war. In 1786 appeared the first part of his "*Ἑκτα πτερόεντα*, or the Diversions of Purley," the object of which

was to prove that all parts of speech could be resolved into nouns and verbs, and that all words were at first applied to sensible objects. The second part appeared in 1805 (new ed. by Richard Taylor, with additions from the copy prepared by the author for republication, and his letter to John Dunning, 2 vols. 8vo, 1829; with additional notes by Richard Taylor, 8vo, 1860). In 1787 he published "A Letter to the Prince of Wales" in regard to his supposed marriage with a Roman Catholic. In 1788 appeared his pamphlet "Two Pair of Portraits," in which he drew a contrast between the two Pitts and the two Foxes. In 1794 he was tried for high treason, with Hardy, Thelwall, and others, mainly on the ground of his participation in the action of the "Constitutional Society," and was acquitted, being eloquently defended by Erskine. In 1801 he was returned to the house of commons by Lord Camelford for the borough of Old Sarum, and he retained his seat till the dissolution in 1802; but the decision of that parliament that no one in priest's orders could be a member disqualified him from sitting again. The latter years of his life were spent at Wimbledon. He was never married, but left several illegitimate children.—See "Memoirs of John Horne Tooke, interspersed with Original Documents," by A. Stephens (2 vols. 8vo, 1813), and "Memoirs of John Horne Tooke, Esq., together with his Valuable Speeches and Writings," &c., by John A. Graham (New York, 1828).

**TOOKE, I. William**, an English clergyman, born Jan. 18, 1744, died in London, Nov. 17, 1820. In 1771 he became minister of the English church at Cronstadt, and in 1774 chaplain to the factory of the Russian company at St. Petersburg, where he remained till 1792. His most important works are: "Russia, or a Complete Historical Account of all the Nations which compose the Russian Empire" (4 vols. 8vo, 1780-'83; French translation, Paris, 1801); "Life of Catharine II., Empress of Russia," an enlarged translation from the French (3 vols., 1797-1800; new ed., 1810); "A View of the Russian Empire during the Reign of Catharine II. and to the Close of the Eighteenth Century" (3 vols., 1799); and "History of Russia, A. D. 862-1762" (2 vols., 1800-'6). **II. Thomas**, an English political economist, son of the preceding, born in St. Petersburg in 1774, died in London, Feb. 26, 1858. In 1838 he published "A History of Prices and of the State of the Circulation from 1793 to 1837, preceded by a brief Sketch of the State of the Corn Trade in the last two Centuries" (2 vols. 8vo). Four additional volumes bring the work down to 1856.

**TOOMES, Robert**, an American politician, born in Washington, Wilkes co., Ga., July 2, 1810. He graduated at Union college, Schenectady, in 1828, studied law at the university of Virginia, and commenced practice in his native place. In 1836 he served under Gen. Scott as captain of volunteers in the Creek war. In 1837 he

was elected to the state legislature, and with the exception of 1841 continued a member till 1845. He was a member of congress from 1845 to 1853, when he was elected a member of the United States senate, and was reelected for the term ending March 4, 1865. He was a prominent member of the extreme southern party, and after the election of President Lincoln was one of the most active in persuading Georgia to secede. The state of Georgia having passed its secession ordinance on Jan. 19, 1861, Mr. Toombs withdrew from the senate on the 23d, and on March 14 he was expelled. He was a member of the confederate congress which met at Montgomery, Ala., was subsequently for a short time secretary of state of the Confederate States, and also served as a brigadier general in the confederate army.

**TOORKISTAN.** See **TURKISTAN.**

**TOPAZ**, a precious stone, a silico-fluoride of alumina, consisting, in 100 parts, of alumina 48 to 58, silica 34 to 39, and fluorine 15 to 18.5. Its specific gravity is 3.4 to 3.65; its hardness is 8, or between that of quartz and sapphire. It is usually colorless, but is sometimes blue, green, or red. The yellow Brazilian topaz when heated becomes reddish, while the Saxon wine-colored topaz loses its color entirely. Topaz is pyro-electric; it crystallizes in the trimetric or rhombic system, the prism generally having dissimilar extremities. When heated in the blowpipe flame it becomes covered with small blisters, while a coarse variety called physalite (Gr. *physa*, to blow) swells up when heated. Its principal localities are: the Ural and Altai mountains, Kamtchatka, Villa Rica in Brazil (of a deep yellow color), Altenberg in Saxony, and the Mourne mountains in Ireland; in the United States, at Trumbull and Middletown, Conn., and at Crowder's mountain, N. C. Physalite is found in Norway and Sweden in very large crystals; one weighed 80 lbs. The topaz is not very highly valued as a gem, though fine specimens sometimes bring very good prices. Tavernier speaks of one belonging to the Great Mogul weighing 157 carats, which was valued at 181,000 rupees. The principal supply is from Brazil, which furnishes about 40 lbs. annually. The white and rose-red are the most valuable. The former are called by the Portuguese *pingas d'agoas* (drops of water), and when cut resemble the diamond in brilliancy. The oriental topaz is the yellow variety of transparent corundum, and belongs to the family of sapphires. (See **SAPPHIRE**.) A yellow variety of quartz is sometimes called false topaz.

**TOPEKA**, a city and the capital of Kansas, county seat of Shawnee co., situated on both banks of the Kansas river, here spanned by a fine iron bridge, 45 m. S. W. of Leavenworth and 800 m. W. of St. Louis; pop. in 1860, 759; in 1870, 5,790; in 1875, 7,272. The streets are wide and regularly laid out. The city is remarkably well built. The state house is a magnificent building. A site has been

purchased by the United States government for a public building, and a state asylum for the insane is in course of construction about 2 m. W. of the state house. The surrounding country is very fertile and contains deposits of coal. The trade of Topeka is large and rapidly increasing. The Atchison, Topeka, and Santa Fé and the Kansas Pacific railroads afford communication with the east and with Colorado and Texas. The river furnishes good water power. The chief manufacturing establishments are three flouring mills, a rolling mill, a foundry and machine shop, two breweries, a broom factory, and several manufacturing of carriages and wagons, and harness and saddlery. There are two national banks, two state banks, two loan and trust companies, and three building and savings associations. The public schools have accommodations for 2,000 pupils, and comprise a high school and seven schools of inferior grades. Other prom-

clude *Le presbytère* (Geneva, 1839; English translation, "The Parsonage," London, 1848); *La bibliothèque de mon oncle* (1848); *Rose et Gertrude* (1845); *Nouvelles genevoises* (Paris, 1845); and *Collection des histoires en estampes* (6 vols., French and German, Geneva, 1846).

**TOPHET**, a spot in a fertile valley S. E. of ancient Jerusalem, called the valley (ge) of Hinnom, or of the children of Hinnom, and hence Gehenna in the New Testament, and watered by the brook Kedron. It was the place where the idolatrous Jews passed their children through the fire to Moloch. At a later period it was used as a spot to throw the garbage of the streets, the carcasses of beasts, and the dead bodies of men to whom burial had been refused; and as a fire was kept constantly burning to consume all that was brought, the word was used metaphorically for hell.

**TOPLADY**, *Augustus Montague*, an English clergyman, born in Farnham, Surrey, Nov. 4, 1740, died in London, Aug. 11, 1778. He was educated at Westminster school and Trinity college, Dublin, took orders, and obtained the living of Broad Hembury in Devonshire. In 1775 he removed to London and preached in a chapel in Leicester square. For several years he edited the "Gospel Magazine." His fame rests principally upon his controversial writings against the Methodists, and a few hymns. He was the great champion of Calvinism in the church of England. An edition of his works was issued in 1794 (6 vols. 8vo; last ed., with "Life," 1 vol. 8vo, 1869).

State Capitol of Kansas.

inent institutions of learning are Washburn college (Congregational), for both sexes; an Episcopal theological seminary; and the colleges of the sisters of Bethany (Episcopal) and sisters of charity (Roman Catholic), for females. The Topeka library association has about 2,000 volumes. Three daily and four weekly newspapers are published. There are 23 religious societies, viz.: 8 Baptist, 1 Christian, 3 Congregational, 1 Episcopal, 1 Jewish, 2 Lutheran (1 Swedish), 4 Methodist (1 German), 3 Presbyterian, 1 Roman Catholic, 1 Spiritualist, 1 Unitarian, 1 United Brethren, and 1 Universalist.—Topeka was laid out in 1854, incorporated as a city in 1857, and made the state capital in 1861.

**TÖPFFER**, *Rudolphe*, a Swiss novelist, born in Geneva, Feb. 17, 1799, died there, June 8, 1846. He began life as a landscape and genre painter, and subsequently became professor of æsthetics at the academy of Geneva. His works in-

**TÖPLITZ**. See TEPLITZ.

**TORENO**, *José María Queypo de Llano Ruiz de Saravia*, count of, a Spanish statesman, born in Oviedo, Nov. 26, 1786, died in Paris, Sept. 16, 1843. In the rising of the Spaniards against the French in 1808 he was sent to England to negotiate for assistance, was afterward repeatedly a cabinet minister, and died in exile. He published *Historia del levantamiento, guerra y revolucion de España* (5 vols., Madrid, 1835-'7; best ed., 4 vols. 8vo, 1848).

**TORFÆUS**, or *Tormodus*, the Latin name of Thormodr Torfason, an Icelandic scholar, born in Engö in 1636, died near Copenhagen in 1719. Frederick III. of Denmark in 1660 made him interpreter of Icelandic manuscripts, of which he made a collection in Iceland. In 1667 he was appointed keeper of the royal collection of antiquities, and in 1682 royal historiographer. Of his works, in which first appeared the northern sagas on the discovery of

America, the most important is *Historia Rerum Norvegicarum* (4 vols. fol., 1711).

**TORGAU**, a town of Prussia, in the province of Saxony, on the left bank of the Elbe, 26 m. S. E. of Wittenberg; pop. in 1871, 10,867. The principal public building is the Hartenfels palace, containing a church consecrated by Luther, whose wife, Katharina von Bora, died here. It has manufactories of linen and woolen goods and a brass foundry. The elector of Saxony and the landgrave of Hesse concluded here a league for the defence of the reformation, March, 1526. In 1576 a conference of Protestant theologians, assembled by the elector Augustus, elaborated here the "Book of Torgau," which formed the basis of the *Concordia Formula*. The town was nearly destroyed in the thirty years' war. In the seven years' war Frederick the Great here defeated the Austrians under Daun, Nov. 3, 1760. Napoleon was the original builder (1810) of the present strong fortifications. Torgau was surrendered to the Germans in January, 1814, after a siege of several months, during which more than 25,000 French soldiers died of typhus fever.

**TORLONIA**, *Alessandro*, prince of Civitella Cesi, Musignano, Canino, and Farnese, marquis of Roma Vecchia and Torrita, an Italian capitalist, born in Rome, June 1, 1800. He is the youngest and most enterprising son of Giovanni Torlonia (born in Siena in 1754, died in Rome, Feb. 25, 1829), who was originally a small shopkeeper, and became a banker of great wealth and influence, and duke of Bracciano. Alessandro increased his patrimony by taking long leases of the salt and tobacco monopolies in the Papal and Neapolitan states, and by other profitable transactions. He became the principal holder of real estate in the city and province of Rome, filled his palace and villa with fine works of art, and rendered many important services to the pope. He has made extensive excavations, and his collection of antiquities is said to rank next to that of the Vatican. The most remarkable of his public enterprises is the draining of Lake Fucino.

**TORNA**, a N. county of Hungary, bordering on the counties of Zips, Abauj, Borsod, and Gömör; area, 239 sq. m.; pop. in 1870, 23,126, chiefly Magyars and Roman Catholics. It is watered by the Bodva, which receives the Torna. The soil is mostly rocky and sterile; the principal products are hemp and wine. About three sevenths of the area is wooded. Capital, Torna.

**TORNADO**. See HURRICANE.

**TORNEA** (Swed. *Torned*). I. A river of Europe, having its source in Lake Tornea-Träsk, in Sweden, and falling into the gulf of Bothnia after a course of about 240 m. It forms part of the boundary between Sweden and Russia. II. A town of Finland, Russia, in the län or government of Uleaborg, at the mouth of the Tornea river; lat. 65° 50' N., lon. 24° 14' E.; pop. about 700. It has a considerable trade in

timber, fish, furs, reindeer skins, tar, &c. Many travellers visit Tornea to see the midnight sun, visible here from the church steeple in the latter part of June. Most of them proceed to Mt. Avasaksa, about 40 m. N., which offers a more advantageous view. Observations for determining the figure of the earth were made at Tornea by Maupertuis in 1786-'7, and by Prof. Svanberg of Upsal in 1801-'3.

**TORONTÁL**, a S. county of Hungary, bordering on the counties of Csongrád, Csanád, Temes, and Bács, and on Slavonia; area, 2,650 sq. m.; pop. in 1870, 418,010, chiefly Magyars and Roumans. It is watered by the Maros, Theiss, Béga, and Temes. The climate is unhealthy, but the soil is very fertile. The chief products are wheat, maize, melons, flax, rice, tobacco, and wine. Many sheep and horses are raised. Capital, Nagy-Becskerek.

**TORONTO**, a city, port of entry, and the capital of Ontario, Canada, county seat of York co., on the N. shore of Lake Ontario, 310 m. S. W. of Montreal and 86 m. N. E. of Hamilton; lat. 43° 39' N., lon. 79° 21' W.; pop. in 1861, 44,821; in 1871, 56,092. The bay S. of the city is formed by an island, and is about 3 m. long and 2 m. wide. The river Don, which falls into the bay on the east, is not navigable. The site of the city rises gradually from the water and extends back about 2½ m., connecting on the north with the villages of Yorkville and Seaton, and on the east with Leslieville, all of which, except in name, form part of the city. The corporation limits include more than 5,000 acres. The Queen's park, in the centre of the N. part of the city, contains over 35 acres; the jail farm is to be converted into a park in the east; and a few miles W. of the present corporation limits, on Humber bay, 300 acres has been secured for a park. The streets intersect at right angles. The buildings in the chief business streets are of brick, white or red, or of cut stone; and whole streets of fine residences of white brick have been built up within a few years, while other streets are occupied chiefly with wooden structures. Among the public buildings are Toronto university and University college building, the finest in the province, erected in 1859 at a cost of about \$900,000; the government house, the official residence of the governor of Ontario; the custom house and the post office; the Grand opera house and the Royal opera house, each capable of seating over 1,500 persons; the central prison, which cost nearly \$500,000; the city hall and St. Lawrence hall; Trinity college, a church of England institution; Knox's college, a Free church theological institution, just completed at a cost of about \$30,000; the college of technology; the normal school buildings; the legislative buildings, in which also are some of the executive departments; Upper Canada college, a preparatory school for University college; and Osgoode hall, the seat of the principal law and equity courts of the province and the headquarters

of the benchers of the law society. There are 78 churches, the principal of which are St. James's cathedral, commenced in 1852, and recently completed by the erection of a spire 316 ft. high, at a cost of about \$220,000; St. Michael's cathedral, Roman Catholic; the Metropolitan church, Methodist, costing \$100,000; St. Andrew's, church of Scotland, \$80,000; and the Baptist church. The two principal markets are the St. Lawrence and the St. Andrew's, the latter just completed.—Toronto has railroad communication with the United States and with the principal points of the provinces of Ontario and Quebec by means of the Grand Trunk, the Great Western, the Northern, the Toronto, Grey, and Bruce, and the Toronto and Nipissing lines. The imports for the year ending June 30, 1874, were \$14,716,824, and for the next year \$14,436,091. The

official returns of exports show in each of these years less than \$1,900,000, but they are imperfect. The customs revenue collected in the first of these years was \$1,967,997 60, and in the last \$1,293,644 84. The value of manufactures according to the census of 1871 was \$18,686,093, the chief items being furniture, boots and shoes, rail cars, ale, and whiskey. There are five banks having their headquarters in the city, and branches of five Quebec and Montreal banks. Besides the Toronto savings bank, the assistant receiver general's office, a branch of the Dominion treasury department, receives money on loan at interest; and there are numerous loan societies.—The city is divided into eight wards, each of which annually elects four aldermen, who are vested with legislative and executive powers, and can act as magistrates if possessed of a legal property qualification. The

University of Toronto.

mayor is annually elected by a vote of the rate payers. The assessed value of the real and personal property (not counting stocks in public companies) in 1873 was \$44,765,000; in 1874, \$43,462,512; in 1875, about \$46,000,000. The taxes in 1874 yielded \$608,475. The funded debt is about \$5,000,000; and at the close of 1874 there was \$258,293 to the credit of the sinking fund. The city has a fire alarm telegraph, a paid fire department, and street railways. The water works, which the corporation recently acquired from a private individual, are undergoing improvement and extension, at a cost that will exceed \$2,000,000. The water is taken from the lake, and the sand of the island, across which it passes, is made to act as a filtering basin; the filtered water then passes across the bay in sunken pipes, and is pumped up to a reservoir on a height N. of the city. Among the charitable institutions

are the asylum for the insane, supported by grants of the provincial legislature, and accommodating about 700 patients; the city hospital, the resources of which, arising from an endowment of public lands, are supplemented by an annual legislative grant; a boys' home and a girls' home, for unprotected children; a news-boys' home; a home for female servants out of employment; a house of industry; a Protestant orphan asylum; and the house of providence, belonging to the Catholics, and mainly supported by them. There are a number of common schools, supported at a cost of about \$40,000 a year, besides Roman Catholic separate schools. St. Michael's college (Roman Catholic) has not, like Trinity college, university powers. There are no strictly public libraries, but several semi-public ones, including the legislative library; the library in the normal school, intended for the council of public instruction;

Osgoode Hall library; University college library; the Canadian institute (scientific) library; and the mechanics' institute library. Four newspapers are issued daily, and 17 weekly; and there are 15 literary, scientific, and theological magazines, 11 monthly, 4 bimonthly, and 1 quarterly.—The site of Toronto was selected by Governor Simcoe in 1794 as the seat of the provincial government; and here the capital of Upper Canada remained till 1841, when Upper and Lower Canada (now Ontario and Quebec) formed a legislative union. From 1849 to 1858 Toronto was alternately with Quebec the seat of the united government; and in 1867, when the confederation was formed, it became the permanent capital of the province of Ontario. It was taken by the Americans in 1813, and the legislative buildings and archives were burned. It was known as York till 1834, when it was incorporated as a city.

**TORPEDO**, the generic and popular name of the electric rays or skates of the family *torpedinidae*. They were called *váπκη* by the Greeks and *torpedo* by the Latins; the Germans call them *Krampffisch*, the French *torpille*, and the English cramp fish and numb fish. The body is smooth and rounded; the tail short and thick, cylindrical at the end and keeled on the sides; teeth conical, sharp, and crowded; ventral fins immediately behind the pectorals, dorsals generally two and on the tail, and the caudal subtriangular. The electrical apparatus, which has given the name to the family, is arranged in two masses, one on each side of the skull, between this and the base of the pectorals; it is composed of a multitude of perpendicular gelatinous columns or hexagonal prisms, separated by membranous partitions containing a fluid, freely supplied with blood, and receiving very numerous nervous filaments from the par vagum and trifacial nerves. There are about 20 species, arranged in seven genera, in the seas of all parts of the world; the best known are the species of the Mediterranean and the W. coast of Europe, and of the Atlantic coast of North America, all belonging to the genus *torpedo* (Dum.), in which the mouth is crescentic, the teeth not extending outward beyond the margin of the lips, and spiracles distant from the eyes, with a circular fringe around the opening. The common torpedo of the Mediterranean (*T. marmorata*, Rud.; *T. Galeanii*, Bonap.) is sometimes of a uniform brown, but generally marbled or spotted with darker; it rarely attains greater dimensions than 4 by 2½ ft., or a weight of more than 50 lbs. The spotted torpedo of the same sea (*T. ocellata*, Rud.; *T. narke*, Risso) is yellowish red, with one to five large, rounded, grayish blue spots, surrounded by a brownish circle, with a few whitish dots, and grayish white below. One (or both) of these species occurs on the W. coast of Europe as far as Great Britain, and also, it is said, in the Persian gulf and Indian ocean; they feed on small fish, keeping on the mud or sand at the bottom;

their flesh is eaten along the Mediterranean. Their electrical apparatus is analogous to the galvanic pile; John Hunter counted 1,200 columns in a very large fish, about 150 plates to the inch.—The American torpedo (*T. occidentalis*, Storer) attains a length of about 4½ ft. and a width of 8 ft.; it is dark brown above with a few black dots, and white beneath; eyes very small, and spiracles directed outward and a little forward. In one specimen Prof. J. Wyman estimated the number of plates at between 250,000 and 800,000, about 1,200 prisms in each battery, each 1 to 2 in. in height, and

American Torpedo (*Torpedo occidentalis*).

containing about 100 plates to the inch; the interval between the plates was filled with an albuminous fluid, 90 per cent. water, containing common salt in solution; the ganglia from which the par vagum nerves arise are larger than the brain itself, indicating the great nervous power supplied to the battery.—See ELECTRIC FISHES, and *Leçons sur les phénomènes physiques des corps vivants*, by C. Matteucci (Paris, 1847).

**TORPEDO**, a machine for destroying hostile shipping, ponton bridges, &c., through the agency of subaqueous explosions; that is, a military mine used under water. The germ of the device is to be found in floating powder vessels, which were first used at the siege of Antwerp in 1585, and received their latest application in the attempt upon Fort Fisher, N. C., during the late civil war. David Bushnell, a captain of engineers in the American revolutionary army, made the first practical application of the idea to ordinary warfare. He devised a submarine boat to carry a torpedo, charged with 150 lbs. of gunpowder, to be attached by a wood screw to the bottom of an enemy's vessel, and fired by a clockwork fuse. The first actual trial of the invention was made in 1776, when the boat, under the guidance of Sergeant Ezra Lee, was placed under the bottom of the Eagle, an English ship of war carrying the flag of Lord Howe, lying at anchor in New York harbor. But the sergeant found it impracticable to attach the torpedo, which was cut adrift, and soon exploded. In 1777 Capt. Bushnell directed a drifting percussion

torpedo against the frigate *Cerberus*, lying off New London, and it destroyed a schooner moored alongside. Similar torpedoes were set adrift on the Delaware, but did no harm. (See BUSHNELL, DAVID.) Twenty years later Robert Fulton made vigorous attempts to bring the new weapon into notice, under the name of "torpedo," then first applied by him. Unsuccessful in France, he went to England in 1804, and in 1805 was authorized to make an attempt to destroy the French fleet at Boulogne, which proved unsuccessful. In the same year he blew up the brig *Dorothea*, assigned to him for experimental trial, in the harbor of Deal. This was accomplished by two drifting torpedoes, which, connected by a rope, fouled the hawser; and one of them, charged with 170 lbs. of powder, exploding by clockwork under her bottom, utterly destroyed her. Notwithstanding this triumph, motives of policy, resulting from their sovereignty of the sea, caused Fulton and his new weapon to be rejected by the English government; and he returned to America to encounter ultimately a like repulse, although in 1807 he repeated his experiment successfully in the harbor of New York. Fulton's system included four classes of torpedoes: buoyant mines, held in place by anchors, and provided with a mechanical device by which explosion ensued when they were struck by a vessel; line torpedoes, of the kind used in the destruction of the *Dorothea*; harpoon torpedoes, to be attached to the enemy's vessel by a harpoon shot from a gun, and then to be exploded by clockwork; and lastly "blockship" torpedoes, to be carried on spars projecting from a peculiar kind of vessel, and exploded by contact with the enemy. Just before the close of the war of 1812 preparations were made for an extended use of torpedoes in the defence of our harbors. Col. Samuel Colt first practically applied electricity to the ignition of torpedoes. After experimenting for 14 years, and blowing up several vessels at anchor, he finally, on April 13, 1848, destroyed a brig under full sail on the Potomac, operating by electricity from a station in Alexandria, 5 m. distant. He elaborated a complete system of buoyant submarine mines, which were to be planted in groups quincuncially in the channel to be defended. To connect them with the shore he devised one of the very first insulated cables ever attempted, which was connected with a platinum wire fuse imbedded in a priming of gunpowder. He proposed to arrange a reflector to throw the image of the ship upon a map of the mines at the operator's station. This project, bearing the date of 1836, was discovered among Colt's papers after his death. Although much progress was made in submarine blasting, and an elaborate system of electrical submarine mines was prepared by Capt. Hennebert of the French engineers, no opportunity offered for the further use of torpedoes until the Anglo-French war with Russia. In 1855 a new kind of contact mine, de-

vised by Jacobi, was planted off Cronstadt and at Sebastopol; explosions occurred under the frigates *Merlin* and *Firefly*, but did no serious damage. The Jacobi fuse consisted of a little bottle of sulphuric acid bedded in a mixture of potassium chlorate and sugar. This bottle being broken by the shock, an explosion ensued, which communicated with the charge and ignited the mine. Had not this engineer employed too small charges of powder (8 or 9 lbs.), his success would probably have been more marked. His system included electrical mines as well as mechanical. The destruction of the docks at Sebastopol was effected by the French engineers through the agency of submarine explosions, and the attention of all nations was thus again called to the subject. The result appeared in the defence of Venice in 1859 by Col. Von Ebner of the Austrian engineers, who originated a system more complete than any which had preceded it. During the civil war in the United States, when the confederates had no fleet, the southern ports and rivers were much exposed to attack, and this method of defence was largely used. The first torpedoes in position were discovered in Mud river, near Fort Pulaski, in February, 1862; they belonged to the simple contact class, and occasioned no damage. In October, 1862, the service was formally legalized by the confederate congress, and a torpedo bureau was soon established at Richmond. A special corps of officers and men was raised and trained for submarine warfare; inventions multiplied, and agents were sent to Europe to provide material and get the latest ideas. The southern waters soon became so dangerous as to interfere seriously with naval operations. The first vessel actually blown up by the new machines was an ironclad, the *Cairo*, which was totally destroyed on Yazoo river in December, 1862. During the remainder of the war seven United States ironclads, eleven wooden war vessels, and six army transports were destroyed by torpedoes, and many others were temporarily disabled. The confederates lost a fine ironclad, the *Albatross* (see PLYMOUTH, N. C.), two steamers in Charleston harbor, and a flag-of-truce boat on James river, in the same manner, the last three accidentally by their own torpedoes. This great destruction chiefly occurred in the last two years of the war. In the Schleswig-Holstein war of 1864, Denmark resorted to ingenious stationary submarine mines, and one of the invading vessels was destroyed. Paraguay employed torpedoes in defending its river coast against Brazil and her allies in 1865-'8. By these the ironclad *Rio de Janeiro* was destroyed and the *Tamandare* disabled, although the engineers were crippled by the want of supplies. During the Franco-German war of 1870-'71 the coasts of the Baltic and North seas were effectively protected against the French fleet by torpedoes; and various attempts were made to defend the French rivers in a similar manner.—The recent

changes in naval architecture, which have produced iron-clad vessels capable of enduring for a few moments the heaviest fire of modern artillery, have rendered it necessary to devise means of striking the remaining vulnerable points, viz., the deck and the bottom. The former can be attacked advantageously in many localities only by the vertical fire of mortars; the latter can be most effectively assailed by the torpedo. The chief nations have accordingly established special schools for investigating the subject of submarine warfare, and all possible secrecy is thrown around these studies. In the United States, Great Britain, and other countries a distinction is made between the defensive and offensive branches. The American school for defensive torpedoes is at Willet's Point, New York harbor. The general principles which must govern this service are well established. The most vulnerable points of maritime nations are now their great seaboard cities; hence it is of primary importance to protect the seaports. The invention of the screw propeller and of iron armor has enabled fleets to steam rapidly past the forts, under cover of night or fog, and anchor securely in positions where their fire can either destroy the city or compel the payment of an enormous ransom. The great problem of coast defence is, therefore, to devise an effective obstruction of the channel, which, while allowing the free passage of friendly vessels, shall bar the way to an enemy. This is supplied by defensive torpedoes planted and operated from the forts. If by their aid the enemy can be detained 100 hours under the fire of the forts, when without it he could pass in one hour, the number of the guns is virtually multiplied by 100. For these reasons military engineers are giving the closest possible study to defensive torpedoes, or submarine mines as they are often called. While the details of our system of submarine defences are not made public, its general features have been announced. In a deep casemate of the fort, secure from the fire of the enemy, are placed electrical batteries, operating apparatus, testing galvanometers, &c., under the charge of a thoroughly trained engineer sergeant. A telegraph wire keeps him in constant communication with his officer, who is posted at some commanding point, where the whole channel lies like a map before him. Radiating from the casemate, in subterranean galleries, the torpedo cables extend to the channel, where they terminate in multiple groups of mines so arranged as to be perfectly flanked by the guns of the work. The details of these mines are not public, but an idea of their general construction can probably be formed from fig. 1, which represents the Austrian type. It consists of an anchor, *a*; a buoyant case, *b*, containing the charge, fuse, and circuit-closing apparatus; and the electric cable, *d*, extending to the operating room on shore. These groups are so placed, in successive lines and outlying mines, as to render it

impossible for a vessel to pass without moving over some of them. Thickly rising, but never exposed to view, are numerous buoys, each containing a simple electrical apparatus, which instantly reports to the sergeant the locality of any vessel touching them. If friendly, the ship passes in safety; but if an enemy, a single motion of the sergeant makes every mine an automatic agent of destruction, ready to deal a tremendous blow at the precise instant when it will be most effective. As the buoys may be slightly in rear of the mines, all attempts to protect the vessel by outrigging frames or nets are futile. Any boat attempting to grapple the torpedoes by night will be overwhelmed by a fire of grape or case shot from the fort, fired automatically by

FIG. 1.—Austrian Submarine Mine.

electricity, without the agency of the soldiers sleeping quietly by the guns. The mines are as effective a year after they are planted as when first laid; and if a single cable be injured or a single charge be wet, the fact is automatically reported, and within five minutes after the injury has occurred its existence and nature are known in the fort. A mine can be fired without the aid of the buoys. For secondary channels, the use of which could be sacrificed for a time, less elaborate kinds of torpedoes are provided, not unlike those employed by the confederates in the late war. These mines, once planted, are dangerous alike to friend and foe, as they explode on contact with any vessel. The electric light is employed to aid the forts in arresting operations attempted under cover of the night. Where constant currents exist, as in rivers, use can sometimes be made of double drifting torpedoes, so arranged as to foul with the connecting rope the hawsers of vessels at anchor. On the torpedoes being brought alongside by the force of the current, the same agency, acting on a simple piece of mechanism, soon releases a hammer and causes an explosion.—Offensive torpedoes are employed in the battles of vessels with vessels, and require technical naval skill. They are various in principle, and are receiving the careful study of many naval officers of all nations. The American school for offensive torpedoes is at Newport, R. I. The principal types of this class are the following: spar torpedoes, automatic fish torpedoes, otter or Harvey torpedoes, submarine rockets, and submarine boats. Besides these, there is a mixed class, that of fish torpedoes, which may be directed and controlled through the agency of electricity. These last may be either offensive or defensive. The spar torpedo has given occasion for some of the most brilliant naval

exploits on record, such as that of Lieut. Cushing in the destruction of the *Albemarle*. Fig. 2 represents the Wood and Lay apparatus used by him. A reserve torpedo, *a*, is shown on its spar *b*. The port torpedo *c* is about to explode. It has been detached from its spar *d* by a pull on a rope, and is rising by its own buoyancy to be fired at the proper moment by the lanyard *e*. Since the civil war boats espe-

FIG. 2.—Wood and Lay Torpedo.

cially fitted for this kind of attack have been devised by many nations, but the same kind of torpedo may be used from any vessel possessing the requisite speed. The automatic fish torpedo, of which the Luppis Whitehead is most widely known, consists of a small cigar-shaped boat *a*, fig. 3, carrying a contact torpedo in the bow, and containing an engine driven by some powerful agent, like compressed air, which, acting on the propeller *b*, gives it an effective range of about 300 yards. It is started usually from a large vessel, but sometimes from a launch or boat, and passing under water strikes and destroys the object of attack. Usually a directing tube is employed, but for simplicity the engraving shows a device sometimes used in experiments. The otter or Harvey torpedo is emphatically a sailor's wea-

FIG. 3.—Luppis Whitehead Torpedo.

pon, requiring high nautical skill for its use. It consists of a thin vertical copper torpedo case, enclosed in wood, *a*, fig. 4, and so attached to a tow rope, *b*, leading from a reel on deck through a leading block on the yardarm, as to diverge from the quarter of a fast vessel, whose duty it is to move rapidly past the enemy. The course is so directed as to bring the torpedo in contact and explode its charge under his bottom. This is accomplished by skilfully caus-

ing the case to dive at the proper moment, by the slackening of the tow rope, and then, by suddenly checking the latter, making the torpedo rise and explode by contact, either through the agency of a contact fuse acted upon by the levers *c*, or by electricity. The cork buoys *d* are used to give the requisite flotation. Official trials in England have shown that when properly handled this is a most effective

weapon, and one which admits of use on the high seas as well as in harbors. Submarine rockets, in connection with submarine guns, are now receiving much attention. The design is to render it possible to attack the enemy under his armor by a movable torpedo, in a manner analogous to the ordinary fire of

artillery in air. Experiments lead to the belief that this project will ultimately be successful, for the short ranges usual in the combats of armor-plated ships. Submarine torpedo boats

FIG. 4.—Harvey Torpedo.

have been an object of study since the days of Bushnell; and, under the name of *David*, they played a conspicuous part during the civil war, in which the *Housatonic* was sunk off Charleston by a night attack of this description. The French *plongeur* is a more elaborate type of the same class. The general idea is to form a water-tight vessel, propelled by compressed air, which can be navigated under water to the enemy, there to deliver a blow through the agency of a contact torpedo. As success, and even failure, has heretofore often involved the lives of the crew, the project is not now regarded with much favor. Indeed, it may be said to be superseded by fish torpedoes controlled by electricity, which may be made equally effective without endangering the operators. This device consists essentially of an ordinary fish torpedo, which carries a coil of insulated wire to be paid out as it proceeds. One end of the wire remains with the operator, who can thus at will send a current of electricity, positive or negative, through certain electro-magnets in the fish,

causing a motion of the armatures in either of two directions. This enables him by ingenious devices to control valves which apply the motive power as desired, and thus start, stop, and steer the boat. The idea was first patented by Lieut. Col. Ballard, R. E., but it has been independently elaborated by Mr. Lay, by Mr. H. J. Smith of this country, and by Col. Scheliha in Russia. A modification of the idea has been made by Capt. Ericsson, who places his motive power (compressed air) with the operator, and supplies it to the fish through a flexible tube, thus enabling him to control both its speed and direction. The tube is drawn after the fish as it advances. This kind of torpedo seems to be especially fitted for use on shipboard, where the engines may be made to supply the compressed air, and where, by advancing upon the enemy, a short range can usually be secured.

**TORQUATUS**, *Titus Manlius Imperator*, a hero of Roman story, of the 4th century B. C. He was brought up in privacy in the country, on which account in 362 the tribune M. Pomponius charged his father, who was hated by the people for his haughtiness, with being a tyrannical parent. The young Manlius compelled Pomponius to withdraw his accusation; and this act of filial devotion so pleased the Romans that he was made the same year military tribune. In the Gallic invasion of 361 he slew in single combat a gigantic enemy on the bridge over the Anio upon the Salarian road, and took from his neck the chain (*torques*) and put it around his own; from which circumstance he was called Torquatus. In 353, though he had not yet held the consulship, he was made dictator in order to carry on the war against the Cœrites and their allies, and in 349 was again made dictator for the purpose of holding the comitia. He was consul in 347, 344, and 340. In 340 his colleague was P. Decius Mus, and the two were appointed to carry on the war against the Latin league. While they were in the plain of Capua an order was issued forbidding all single encounters with the enemy; but Titus Manlius, the son of Torquatus, fought with Mettius Geminus of Tusculum, and slew him. Returning to the camp, he laid the spoils at his father's feet; but Torquatus assembled the soldiers in the prætorium, and in their presence his son was beheaded. The young men of Rome from that time regarded Torquatus with abhorrence. In this campaign a great victory was gained over the Latins at the foot of Mt. Vesuvius, and Torquatus returned to Rome in triumph. According to the *Fasti*, he was dictator again in 320, but the dates of his life vary in different authors.

**TORQUAY**, a town of England, in Devonshire, on a peninsula on the N. E. side of Tor bay, 167 m. W. S. W. of London; pop. in 1871, 21,657. It has two principal streets lined with substantial houses of limestone, with several fine churches, a town hall, theatre, numerous schools, assembly and reading rooms, a me-

chanics' institute, and a public garden. Earthenware, yellow ochre, cider, and fish are exported. It has grown up within 50 years from a fishing village, and owes its progress mainly to its fine climate, making it a desirable health resort. Tor bay is a large and well protected harbor. William of Orange landed here in 1688. In the vicinity are the ruins of Torquay abbey, founded in 1196. About a mile from the town is Kent's hole, or cavern, in which have been found bones of the elephant, rhinoceros, bear, hyæna, and other animals now extinct in England. It has been penetrated to the depth of 600 ft., and scientific explorations are still in progress.

**TORQUEMADA** (Lat. *TURRECREMATA*), *Juan de*, a Spanish theologian, born at Valladolid in 1388, died in Rome, Sept. 26, 1468. He became a Dominican friar in 1403, accompanied his superior to the council of Constance in 1417, graduated in the university of Paris in 1424, taught theology there, and was successively chosen prior of the Dominican convents of Valladolid and Toledo. In 1431 he was appointed by Pope Eugenius IV. "master of the sacred palace," and his own theologian at the council of Basel. He there contributed to the solemn condemnation of the doctrines of Wycliffe and Huss, and maintained that the doctrine of the immaculate conception was divinely revealed. In 1439 he attended the council of Florence as papal commissary, and was foremost in drawing up the "articles of reunion" between the Greek and Latin churches, receiving on this occasion from the pope the title of "defender of the faith." He was made a cardinal on Dec. 18 of that year. In 1440 he attended in the pope's name at the national council of Bourges, where he succeeded in keeping the French prelates on the side of Eugenius IV. He became bishop of Palestrina in 1455, and of Sabina in 1464. His most important works are: *Meditationes Joannis de Turrecremata positis et depictis de ipsius mandato in Ecclesia Ambitu Sancta Mariæ de Minerva* (fol., Rome, 1467, with 34 engravings on wood); *Expositio brevis et utilis super toto Psalterio* (4to, Rome, 1470; fol., Augsburg, 1472, with many subsequent editions); *Questiones Spiritualis Conviviî delicias præferentes super Evangeliiis* (fol., Rome, 1477; Nuremberg, 1478); *Commentarii in Decretum Gratiani* (6 vols. fol., Lyons, 1519; Venice, 1678; 2 vols., Rome, 1726). Many of his works have not been published.

**TORQUEMADA**, *Tomas de*, the first Spanish inquisitor general, born at Torquemada about 1420, died in Ávila, Sept. 16, 1498. He became a Dominican and prior of the monastery of the Holy Cross in Segovia, and in 1483 was made inquisitor general for Spain by Ferdinand and Isabella, in which post he was confirmed by the pope on Oct. 17. From him the inquisition received its thorough organization. Tribunals were established at Seville, Cordova, Jaen, and Ciudad Real (later transferred to

Toledo), and a code was promulgated by which the Spanish inquisition was afterward governed. Jews and Moors were expelled under his control, and he so multiplied *autos de fe* that Alexander VI. intervened and gave him four colleagues to moderate his zeal.

**TORRES VEDRAS**, a town of Portugal, 25 m. N. N. W. of Lisbon, on the left bank of the Sizandro; pop. about 4,200. Part of its ancient walls and an old fortress still remain. In the vicinity are an aqueduct with Gothic arches and the noted convent of Varratojo. It has four churches, two hospitals, a Latin school, and a considerable trade in wine. It gave its name to the defensive lines erected by Wellington in 1810 on a range of heights in its neighborhood, which took nearly a year for their completion, and set the army of Masséna at defiance.

**TORREY, John**, an American botanist and chemist, born in New York, Aug. 15, 1796, died there, March 10, 1873. He graduated at the New York college of physicians and surgeons in 1818. While a student there he was one of the founders of the New York lyceum of natural history, of which he was for many years president. In 1824 he became professor of chemistry, mineralogy, and geology at West Point, and in 1827 was called to the chair of chemistry in the college of physicians and surgeons, which he held till 1854. He was also at the same time professor of chemistry in the college of New Jersey; and in 1836 he was appointed botanist of the geological survey of the state of New York. In 1854 he became United States assayer at New York, which office he held until his decease. Though better known as a botanist, he was a profound chemist, and was the frequent confidential adviser of the government, especially in matters relating to coinage and currency. Dr. Torrey's first publication was "Catalogue of Plants growing spontaneously within Thirty Miles of the City of New York" (Albany, 1819). In 1824 he published the first volume of the "Flora of the Northern and Middle States." This was not continued, but in 1826 he gave in a "Compendium," in a condensed form, the materials he had accumulated. In 1838 he began the publication, in connection with Prof. Asa Gray, of the "Flora of North America," which appeared at intervals till 1843, when it was discontinued on account of the vast amount of new material brought to light by exploration. From 1822 to 1858 he prepared the botanical reports, some of them in connection with Dr. Gray, of most of the United States exploring expeditions. Among his other publications are "Cyperaceæ of North America" (1836), and "Flora of the State of New York," in the series of reports of the natural history survey of the state (2 vols. 4to, 1843-'4). He was also the author of numerous botanical, chemical, and mineralogical papers in the "Smithsonian Contributions" and other scientific publications. His herbarium,

the result of 40 years' collection, and his botanical library, one of the most valuable in the country, were transferred to Columbia college some years before his death.

**TORREYA**, a genus of evergreen coniferous trees, named by Arnott in honor of Dr. John Torrey, from specimens collected in Florida by the late Mr. Croom. It belongs to the yew tribe of conifers, in which the fruit does not form a proper cone, but becomes a sort of fleshy fruit or drupe. The Florida species, *T. taxifolia*, is confined to a rather limited locality near Aspalaga, on the Appalachian river, in middle Florida; it is 20 to 40 ft. high, with a trunk 6 to 18 in. through, and has much the general aspect of the common hemlock spruce (*Abies Canadensis*). There was formerly a considerable forest of Torreya, but all the trees not growing in inaccessible ravines have been used for lumber and steamboat fuel. The leaves, mostly in two rows, are about 1½ in. long, thick, rigid, sharp-pointed, and rather light green; the flowers are dioecious, the fertile ones bearing a drupe about the size and shape of a small olive,

*Torreya taxifolia*. Leaves half the natural size; staminate and pistillate aments enlarged; fruit and a section reduced.

consisting of a hard nut surrounded by a thin pulp. The wood, which is very durable, gives off when sawed or burned a strong terebinthinate and somewhat unpleasant odor, on which account it was called in Florida "stinking cedar." The tree has proved hardy in the latitude of New York.—Not long after the discovery of the original species, Siebold and Zuccarini described *T. nucifera*, discovered in northern Japan, but cultivated in all parts of that country, where the oil obtained from its seeds is used for culinary purposes. Another species, discovered by Fortune in the mountains of northern China, and described as *T. grandis*, is a large fine tree, possibly not belonging to this genus. Among the wonderful stories told about California in the early days of its present era was the discovery of the nutmeg tree growing wild in the mountains, and the tree was mentioned as *myristica Californi-*

*ca*; materials were sent to Dr. Torrey, who found it to be a new species of the genus bearing his name, and he described it as *T. Californica*. It grows from 40 to 50 ft. high, and has a smooth bark, and leaves from 2 to 2½ in. long; the nut bears much similarity in size and shape to the nutmeg, and the ruminated albumen shown when it is cut adds to a resemblance that is not borne out by the taste, which is that of turpentine. Another species is mentioned as having been found in the Bogotá Andes, though little is known about it. The Torreyas flourish well in England, but trees of other than the Florida species have not been sufficiently tested to know how they will succeed in our Atlantic states.

**TORRICELLI, Evangelista**, an Italian mathematician, born in Faenza, Oct. 15, 1608, died in Florence, Oct. 25, 1647. He received a mathematical education in a Jesuit school at Faenza, which he completed at Rome. Some tracts written by him upon the dialogues of Galileo excited the latter's attention, and he invited Torricelli to Florence, who soon became his successor in the academy as professor of mathematics. His greatest discovery is that of the barometer. (See BAROMETER.) He published *Opera Geometrica* (4to, Florence, 1644).

**TORSION BALANCE.** See BALANCE.

**TORSK, or Tusk.** See CUSK.

**TORSTENSON, Lennart**, count of Ortala, a Swedish general in the thirty years' war, born at Torstena, Aug. 17, 1603, died in Stockholm in April, 1651. In 1618 he became a page at the court of Gustavus Adolphus, and as captain of the king's body guard accompanied him to Germany in 1630, where he directed the artillery. In 1632 he contributed materially to the passage of the Lech, but was captured during the assault on Wallenstein's headquarters near Nuremberg. He was carried to Ingolstadt, and the severity of his imprisonment made him an invalid for life. On his exchange and release he was placed at the head of an army corps, and in 1633 he invaded Bavaria and captured Landsberg. In 1635 he operated against the Poles in Prussia, and subsequently marched to the relief of Baner, and was with him in the campaign of 1636-7. In 1641 he was made field marshal and succeeded Baner as generalissimo of the Swedish armies in Germany. With a reinforcement of 8,000 men he joined the confederates in the duchy of Lüneburg, marched through the territories of Brandenburg into Silesia, stormed Glogau, and in May, 1642, gained a great victory at Schweidnitz over Franz Albrecht of Saxe-Lauenburg. He then pushed into Moravia and reduced several cities, but retreated to Saxony before superior forces, and laid siege to Leipsic. Here he was attacked on Oct. 23 (N. S., Nov. 2) by the archduke Leopold, on the plain of Breitenfeld, and the conflict resulted in the signal defeat of the imperialists. Torstenson, again resuming the offensive, reduced all Saxony, invaded Moravia, and laid the country under contribution as far as the

Danube. In the mean time Denmark had entered into a secret alliance with the emperor; and Torstenson, marching with wonderful celerity from Moravia into Holstein, late in 1643, soon conquered the Danish peninsula, with the exception of Glückstadt and Krempe. After an abortive attempt on the part of Gallas to check his return to Germany, Torstenson advanced into Bohemia, and on Feb. 24, 1645, gained the battle of Jankau, which secured the submission of Moravia; and, obtaining the control of the Danube, he took even the fortifications which covered the head of the bridge at Vienna. Deserted here by his allies, he retreated into Bohemia, and in 1646 his infirmities obliged him to give up the command to Wrangel. In 1647 he was made a count.

**TORT** (Lat. *tortus*, from *torquere*, to twist), in law, a private or civil wrong or injury, in contradistinction from a crime against the public or the state, but not technically including breaches of contract or other agreements. Torts are injuries or infringements of the civil rights that belong to individuals considered merely as individuals, while crimes are wrongs which affect the community and so invade and violate the rights of society. The distinction between private injuries and public wrongs seems to be much dependent on the constitution and positive laws of civil society. So long as the harm done by an offence is limited to the single individual against whom it was directed, the offender commits only a private injury or a tort; but if the act, though immediately concerning an individual, disturbs the public order or safety and welfare, then the positive law interposes and elevates the hitherto private offence to the degree of a crime or of a misdemeanor. In some cases the injury may be both public and private, or at once a tort and a crime or misdemeanor. For example, the commission of a battery subjects the aggressor to a public prosecution as a disturber of the peace, while the party beaten may have his separate civil action for damages. Libel and nuisance are other examples of this twofold character.—As wrongs are privations or infringements of rights, so torts, being private wrongs, are infringements of private rights, or the rights of individuals. These rights respect either the person or the property. In the former class is included the right of personal security, in respect as well to the body as to the health and the reputation, and the violations of this right in one or other of these respects bear the names battery, assault, nuisance, slander, libel, and malicious prosecution. In this class is included also the right of personal liberty, which is violated by false imprisonment. Rights of property, real or personal, may be infringed by trespasses in various degrees by waste, conversion, and fraud, and the more incorporeal of these rights by nuisance and by infringement of patents and copyrights and rights in trade marks. These several names of torts have been applied by

long usage of the law to prescribed and well determined offences. But besides these there are many torts not specifically designated or classed, because they do not affect well defined classes of rights, but vary with the peculiar circumstances of every case.—When one alleges that a tort has been committed against him, he must show at all events that he has been wronged. The mere fact that the act complained of has injured the plaintiff, does not entitle him to claim indemnity unless the act was also a breach of a legal obligation between the parties, resting either on their express agreement, or on the general policy and rules of the law. If, for example, my neighbor builds a wall just before windows of mine, to which it is conceded I have no prescriptive right as ancient lights; or if in a street occupied by private and costly dwellings my neighbor chooses to use his house for a shop, or convert it to other uses offensive to me and yet constituting no nuisance: in neither case have I ground for action, however considerable the actual injury or damage may be to me. The reason is, that I have not been wronged; it is a case of what the law calls *damnum absque injuria*, damage but no wrong; no legal right of mine has been violated. But every legal wrong imports damage in the very nature of it; and if no other damage is established, the party is entitled to nominal damage. To use Sir John Holt's quaint and familiar illustration: "If a man give another a cuff on the ear, though it cost him nothing, nay, not so much as a little *diachylon*, yet he shall have his action." It is on this principle that, without proving any actual damage, one who has a right of way may maintain an action against an intruder, or one whose lands are flowed against him who constructs a dam so as to set back the water. So a voter can sustain suit against the authorities for refusing his ballot, even though his candidate was elected. These are cases of legal wrongs, infringement of legal rights; and even if no actual damage be proved, the injury or damage is the presumption of the law. To this class also belong those cases of torts in which the legal wrong consists in the doing of a mischievous act which is only likely to prove injurious to others, or even in the doing of a legal act in such a careless or negligent manner that injury may probably result; for carelessness of the rights of others is in itself morally wrong, and by the construction of law is legally wrong when injury results from it.—The commonest form of a tortious intrusion upon real property is called trespass *quare clausum fregit*, or for breaking and entering upon the plaintiff's close. A higher offence against a person, in respect to his property, than mere encroachment on his possession, is that which consists in a usurpation of the property itself. An injury of this nature is most likely to happen in respect to personal property, and one of the most frequent actions for torts of this nature is that of trover. One

may be further injured in his rights of property by the effect of threats, mistake, or fraud. In the last respect, for example, an action lies when one knowingly utters a falsehood to the plaintiff with the design to deprive him of a benefit and to acquire it to himself, and damage naturally results from the plaintiff's belief. But it is not always necessary to show that the defendant intended to defraud the plaintiff particularly. Thus one who makes a false recommendation of another, representing him to be solvent and trustworthy, and with the purpose of obtaining credit for him, is liable to any one who gives credit to the report and thereby suffers injury. The tort of nuisance consists in injury to the more natural rights of individuals, and the tort of infringement of patent and copyrights and rights to trade marks violates rights created and assured by the positive law.—In our examination of torts we have thus far considered persons only in their natural capacity. It is obvious that new rights arise and new wrongs become possible when the individual is clothed with an artificial character; when, for example, he becomes a sheriff, a magistrate, or other public officer. The new functions with which he is invested give him capacity for doing official wrongs; and these, as they affect private individuals, form new classes of torts.—A corporation is liable like an individual for its torts, and it is liable for the wrongful acts of its officers, either where they are expressly authorized to do the acts, or where they were done *bona fide* in pursuance of a general authority. But, generally speaking, it cannot be held for any offences by its servants that are properly, in any case, only personal acts, like malicious prosecution, slander, or false imprisonment. But a corporation has been held responsible for an assault and battery committed by a servant acting under its authority. Municipal corporations are liable in tort for the same acts that would warrant an action against individuals, if such acts are done by the authority of the corporation or of a branch or bureau of its government, authorized to act in the premises to which the particular act relates. Thus they must answer for nuisances on their lands, and they are generally held liable for injuries resulting from the want of care or skill on the part of a public surveyor, from the careless performance of street grading, from neglect to repair streets, sewers, and drains, or from the fury of a mob. The civil liability of municipal corporations for injuries sustained by defects in the highway is generally determined by express statutes.—For the various kinds of torts, and of actions for tort, see ASSAULT, ATTACHMENT, COPYRIGHT, EXECUTION, LIBEL, MASTER AND SERVANT, NUISANCE, PATENTS, SHERIFF, SLANDER, TRADE MARK, TRESPASS, and TROVER.

**TORTOISE**, the popular name of the chelonian reptiles whose habits are wholly or in part terrestrial and fluviatile, including all the

testudinata except the marine species or turtles—that is, the *amyda* of Oppel as distinguished from his *chelonii*. Their general characters have been given under TESTUDINATA. The suborder *amyda*, according to Prof. Agassiz, comprises the following seven families, not equally related to each other: *trionychida* or soft tortoises, *chelyoida* (the matamata), *hydraspidida*, *chelydroida* or snappers, *cinosternoida* or mud tortoises, *emydoida* or terrapins, and *testudinina* or land tortoises. Of the very numerous species here included, space will permit the mention of only a few of the typical forms in the above order of families. Duméril and Bibron divide the *amyda*, according to habitat, into *chersites* or land tortoises, corresponding to *testudinina*, and *élodites* or marsh tortoises, including all the other families except the *trionychida*, which form their *potamites* or river tortoises. Though some pass nearly all their life in the water, none are entirely aquatic, and none can swim unsupported for great distances; when in the water, they usually remain at the bottom, and seldom swim freely except when alarmed or seeking to leave it. Their locomotion is a kind of walking, the weight being about equally distributed on the front and hind limbs, which have nearly the same development, the motions of each pair alternating with each other. The shield or carapace is more symmetrical than in the turtles; the feet are always distinct from the legs, and movable upon them; the toes are either separate and short, or united by a web capable of expansion and contraction; the limbs can generally be withdrawn under the carapace, and the head wholly or partially. The tortoises rank higher in the order than the turtles.—In the *trionychida* the carapace is flat, thin, and oval, and very incomplete, the ribs united only on the median line, and extending thence to the margin like spokes of a wheel; it is covered with a tough skin, flexible on the margins; neck long and flexible; head pointed, and terminating in a long leathery snout; jaws covered with a horny sheath, and the lips fleshy; feet short, broad, and strong, five-toed and fully webbed, three of the toes with claws; limbs only partially retractile and moving horizontally; skin loose and free about the neck and limbs. The oldest geological deposit in which any of this family has been discovered is the greensand of New Jersey. They are active species, preferring the muddy bottom of shallow water, sometimes lying concealed in the mud with only a part of the head exposed, taking breath from time to time by stretching up their long neck and raising the tip of the snout above the surface; they can remain under water more than half an hour at a time, rarely going on land, where their movements are awkward; in the water they move rapidly, striking suddenly at objects by means of their long neck; they prey principally on fish, seizing also frogs, small birds, and young alligators and lizards; the species found

in the Nile is very destructive to young crocodiles; they have been known to attack persons bathing. They are very wary, but are frequently caught on hooks baited with a live fish; their flesh is highly esteemed. Their eggs are numerous, spherical, and very brittle; they are deposited on sandy shores near the water in April and May, and the young appear in July. The genus *trionyx* (Wagler), equivalent to *cryptopus* (Dum. and Bibr.), is peculiar to Asia and Africa, the species of this country formerly referred to it belonging to the genera *aspidonectes* (Wagler), *platypeltis* (Fitz.), and *amyda* (Ag.). The common soft-shelled tortoise of the northern states (*A. spinifer*, Ag.) attains a length of 14 in.; it is yellowish brown, beneath white, mottled, streaked, and dotted with black; a blunt keel along the median line slopes uniformly to the sides, and the anterior margin is furnished with spines; it is found from Lake Champlain to Pennsylvania and west to the Missouri and Mississippi rivers; its flesh is very delicate. Other species are found in the southwestern states. Very large species of this family were brought here from western equatorial Africa by Mr. Du Chaillu.—The *chelyoida* somewhat resemble the preceding family, but the head and neck are more retractile and furnished with numerous membranous fringes and lobes of singular form. There is only the single genus *chelys* (Dum.), and a single species, the matamata (*C. matamata*, Dum.), attaining a length of 2 or 3 ft.; it inhabits the stagnant waters of tropical South America, feeding on fish; it is captured for its excellent flesh.—The *hydraspidida*, containing the genera *platemys*, *podocnemys*, &c., were united to the chelyoids by J. E. Gray, the two forming the *élodites pleurodères* of Duméril and Bibron. The neck is long, the head retractile or bent laterally under the shield; in some the skull presents the union of the temporal and parietal bones to form a broad roof over the temporal region, as in marine turtles, combining thus the family characters of the two suborders. Prof. Agassiz thinks that *podocnemys* will be found to agree more closely with the earlier geological types than with any other, and that the group of *pleurodères* bears the same relation to other testudines as the marsupials do to ordinary mammals. The sexual differences are so great that they have been mistaken for specific; the tail of the male is much the longer, and in this sex there are sharp asperities between the joints of the hind legs; the colors are also different. This group is foreign to the United States, and mostly South American, a few being found in Africa and Madagascar.—The *chelydroida*, described in the article SNAPPING TURTLE, are thoroughly aquatic, and the lowest of the *amyda* except the preceding families; they are characterized by their keeled back, serrated margin, broad, flat, and imperfectly retractile head, narrow and cross-like sternum, and large tail.—The *cinosternoida* have a long

and narrow body, the carapace rising to behind the middle, and thence descending steeply backward; the whole shield is ossified, covered with large horny scales, and as wide behind as in front, with a tendency of the edges to round up and turn inward; the tail is neither long nor strong enough to bear any of the weight of the body, and in the male ends in a horny nail; legs slender, feet short and round, toes freely movable and webbed, and the whole very flexible; head long behind and short in front of the eyes, pointed, with the small mouth underneath; alveolar ridge sharp, the lower jaw ending in a point; neck long and slender; the plastron is sometimes hinged. In average size they are the smallest of the order, the least being about 4 in. and the largest 9 in. in length; all are American, and no trace of their fossil existence has been discovered; the sexes are very different. They live mostly in water and in the mud, coming out to bask in the sun in places where they can readily drop into the water at the approach of danger; their food is principally animal, and their motions quick, though feeble and awkward; generally timid, they bite fiercely if attacked while feeding, like the insectivora among mammals. The colors are generally dark, sometimes with reddish, greenish, and yellowish tints. They lay three to five eggs, on the shore near the water, in holes dug with their hind feet; they are elongated, with a smooth and shining surface, thick, and brittle. In the common mud tortoise (*Thyroesternum Pennsylvanicum*, Ag.), the jaws are strong and cutting, and the mouth long and narrow; it is dusky brown above, yellowish dusky or brownish below; chin and throat dirty yellow, with the warts on the latter brighter; it is usually about 3½ in. long, nearly 3 in. wide, and 1½ in. high. It is found from Pennsylvania to Florida, and west to the Mississippi valley; the anterior and posterior parts of the sternum are movable on the central piece; it abounds in muddy ponds, feeding on small fish and aquatic insects and larvæ; it is a pest to anglers, seizing the bait set for better game; it has a slight odor of musk, but less so than the musk tortoise (*Ozotheca odorata*, Ag.), which ranges from New England to Florida, and west to the Mississippi.—The *emydoidæ* are most numerous in species, over 60 being described, presenting great differences in size, structure, and habits. The body is ovate, swelling in the centre, the margin with a tendency to spread outward; the carapace is completely ossified and united by sutures, high and irregularly convex in all directions; plastron long and broad, and sometimes hinged; the jaws horny, without lips, and not terminating in long sharp points; head, neck, and limbs completely retractile; nostrils at the end of the snout, which is not prolonged into a proboscis; toes long and webbed, or short and free, according as the habits are aquatic or terrestrial; skin of head, neck, limbs, and

tail more or less scaly. They are principally aquatic, though some are terrestrial, the limbs moving horizontally while swimming, and walking being performed on the whole foot (as in plantigrades); they are generally of moderate size, the smallest being 4 in. and the largest (the aquatic) 15 in. in length. The food is both animal and vegetable, consisting of fish, worms, larvæ, berries, leaves, and grass; they are most abundant in warm regions. The eggs are laid in holes dug by their hind legs, the terrestrial species laying 2 to 7, and the aquatic 10 to more than 80; the shell is less calcareous and more flexible than is usual; the shape is oblong. Though this family is most numerous in North America, there is not a single species described under the genus *emys* by herpetologists which belongs in it; the so-called *cistudo Blandingii*, corresponding to the *emys* of Europe, is the only representative here of Brongniart's genus; the others belong to various genera as established by Agassiz in vol. i. of his "Contributions to the Natural History of the United States" (1857). The genera *trachemys* (Ag.), *ptychemys* (Ag.), *deirochelys* (Ag.), and *malacoclemmys* (Gray) have been described under TERRAPIN. The

Shell of the Painted Tortoise (*Chrysemys picta*).

common painted tortoise (*chrysemys picta*, Gray) may be known by the yellow borders of the black dorsal scales, the blood-red blotches and lines on the marginal plates, limbs, and under part of tail, and the golden yellow sternum. It is found as far north as New Brunswick, through the eastern and middle states to South Carolina and Georgia; west of the Ohio it is replaced by the *C. marginata* (Ag.); it is about 6 in. long, 4½ in. wide, and 2½ in. high; it is most abundant in ditches and sluggish waters, spending most of the day basking in the sun; it is very timid, hibernates early, and is one of the first to appear in spring; it feeds on insects, worms, tadpoles, &c., and is very troublesome to anglers; it will survive only a few days out of the water. The speckled or spotted tortoise (*nanemys guttata*, Ag.) is another very common species, distinguished by its yellow dots on a black ground, and its blackish sternum bordered with yellow. It is found from New England to the Carolinas,

east of the Alleghanies; it often comes on land, to feed on worms and orthopterous insects; it is about 5 in. long, 3 in. wide, and 1½ in. high. The geographic tortoise (*graptemys geographica*, Ag.) is so called from the network of reddish brown lines spread irregularly over the dark brown carapace, somewhat resembling the outlines of countries on a map. It is one of the most active and bold of the family,

Shell of Speckled Tortoise (*Nanemys guttata*).

and is found from New York and Pennsylvania to Michigan, Tennessee, and Arkansas; it is over 8 in. long, 6 in. wide, and 3 in. high, with a tail of 2½ in. The sculptured tortoise (*glyptemys insculpta*, Ag.) is very common in the northern states as far south as New Jersey; the carapace is reddish brown, each scale with radiating yellow ridges, often smoothed down in old specimens; marginal plates and sternum yellow, each with a black spot at the posterior angle, and generally with concentric striae; limbs brick-dust color below; it is 8 in. long, 5 in. broad, and about 3 in. high, with a tail of over 2 in.; it passes long periods away from water. Blanding's tortoise (*emys bleaieri*, Ag.) is the only true species of the genus here; it is black above with numerous yellow spots, sometimes arranged in lines; below dusky yellow, each plate with a large quadrangular dark spot at the outer and posterior angle. It is found from New England westward to Wisconsin, being most abundant on

Sculptured Tortoise (*Glyptemys insculpta*).

the prairies, and very terrestrial in its habits; it is 8 in. long, 5½ in. wide, and 3 in. high, with a tail of 2½ in. The box or checkered tortoise (*cistudo Virginea*, Ag.; *C. clausa* and *Carolina* of other authors) has a rough and strong shell, generally of a light brownish color with very numerous bright yellow blotches and lines, more or less radiating, giving somewhat the appearance of tortoise

shell; sternum usually yellowish with dark blotches; hind feet plantigrade; plastron with a hinge in the middle, so that the anterior and posterior portion can each be brought in contact with the carapace, and enclose the animal in a perfect box. It is about 6½ in. long, 4½ in. wide, and 2½ in. high; it is found from New England south to the Carolinas, and west

Shell of Box Tortoise (*Cistudo Virginea*).

to Michigan; it is entirely terrestrial, and a very poor swimmer; it is common in the pine barrens of the southern states, where it is called cooter and pine terrapin by the negroes; it feeds on insects and succulent plants, and is easily domesticated.—In the *testudinina* or land tortoises the carapace is entirely ossified, very convex in the middle region, but well balanced; the plastron is broad, flat, and solid; openings for protrusion of limbs small and narrow; head, limbs, and tail completely retractile within the shell, and the plastron in some with movable lobes; head small and shielded, nose broad, and eyes far apart; alveolar margin with a sharp edge, and the jaws fitting closely by ridges and furrows; skin everywhere more or less scaly; toes mostly concealed under the skin, as far as the last joints, which are free and covered by flat sharp nails, usually five anterior and four posterior; feet short, stout, and somewhat clubbed; the great intestine is longer and the lungs are larger than in any other testudininate, in relation with the greater convexity of the shell. They are most abundant in warm climates, and are the largest of the order, the great Galápagos tortoise being 3 to 4 ft. long, the African coui (*psammobates radiatus*, Fitz.) 1½ ft., the gopher 1 ft., and the common European land tortoise 8 in. (the smallest of the family). Here also belongs the fossil gigantic *colossochelys Atlas* (Cantl. and Falc.), from the Sivalik hills, which must have measured nearly 18 ft. in length; it is found with the great extinct ungulates which it so much resembled in gait and habits. There are no tortoises indigenous to the British islands, though they might easily be naturalized there. Agassiz places all the American *testudinina* in the genus *xerobata*. They live entirely on land, and when put into water walk on the bottom; the body is raised on the last joint of the toes, and the gait is firmer, more steady, and less slow than in any other tortoise. Their food consists of succulent plants and fleshy fruits. There are only eight genera, but many species. The gopher tortoise (*testudo polyphemus*, Daudin) is about 15 in. long, and has a nearly flat shell, the plates marked with concentric striae disappearing in old age; the plastron is thick and firm, projecting beyond the carapace in front, and deeply emarginate behind; the head is short,

thick, and obtuse, covered with plates; the eyes are large, with a dark iris; the jaws covered with horny, serrated plates; the neck short, and its skin granulated; the fore limbs very large and thick, compressed antero-posteriorly, with five fingers armed with strong nails; along the outer edge of the forearm is a row of projecting horny points; the hind limbs are short, thick, rounded, with four toes armed with strong nails. The general color is brownish yellow, with darker brown tints, the head almost black, the lower parts dirty yellow, and the limbs dusky. It is found in Florida, Alabama, and Georgia, but does not appear to go north of the Savannah river. Like the rodent gophers, they burrow in the ground, preferring such dry and sandy places as the pine barrens, where they exist in troops; they live entirely on vegetable food; they are fond of basking in the sun, though they cannot bear its full summer heat, and cannot endure rain; they become torpid in winter. The adults are very strong, moving with a weight of 200 lbs., and the females are the largest; the flesh and the eggs are esteemed as food. In the European land tortoise (*testudo Græca*, Linn.) the carapace is oval, somewhat widest and gibbous behind, marbled with black and yellow; plastron pale yellow with a wide blackish band down each side; legs short, and tail ending in a horny tip. It is found in Spain, Italy, Greece, and other countries bordering on the Mediterranean; in England it has been domesticated and known to live more than a century. The Galápagos tortoise (*megalocheilus Indica*, Fitz.; *testudo elephantopus*, Harlan) is the largest of the order, frequently measuring 12 ft. in circumference; the shell is very convex and of a deep brown color. It is very fond of water, drinking large quantities, and delighting to wallow in the mud like a pachyderm; some live in the mountains and others in the low lands of the Galápagos islands, and the latter in their journeys after water in the elevated regions have worn well beaten paths, which led mariners to the discovery of the springs, often at a great distance from the shore; they drink by immersing the head up to the eyes, and swallowing great mouthfuls, about 10 a minute, according to Darwin; their flesh is excellent and largely used both fresh and salted, and a very clear oil is made from the fat. They feed on succulent plants and vegetables, and in captivity are fond of cabbage, lettuce, and marrows. They were formerly very numerous in these islands, and probably live for centuries. Their gait is very slow, about two miles in 24 hours, though they have been known to travel four miles in the same time. The eggs are laid in October in the sand, and are about 8 in. in circumference; the young are devoured by birds of prey; in Great Britain, where numbers have been kept alive, they go under ground in November and reappear in the middle of April; many have been seen in the Uni-

ted States.—The tortoise shell of commerce is the product of the hawk's bill or imbricated turtle. (See *TURTLE*.)

**TORTOISE PLANT**, a plant of the yam family, from the Cape of Good Hope, also called elephant's foot, these two common names being equivalent to its systematic name, *testudinaria elephantipes*. While its habit is strikingly unlike that of the yam (*dioscorea*), it is so close to that in flower and fruit that a description of one will answer for both. (See *YAM*.) The yam makes an underground, thin-skinned, tuberous root, or rootstock; but in this the same portion is above ground, and very large, while the stem proper is slender; several stems from the same rootstock climb to the height of 20 to 40 ft., throwing off numerous branches, which bear bright green heart-shaped or kidney-shaped leaves. It is often cultivated as a greenhouse climber for its pleasing foliage, and for its curious rootstock; this is hemispherical or nearly globular, and sometimes 8 ft. in diam-

Tortoise Plant (*Testudinaria elephantipes*).

eter; its exterior is covered with a thick cork-like substance, which cracks and forms many-sided protuberances, separated by deep fissures, giving the whole much the appearance of the shell of a large tortoise; the brown color and apparently lifeless character of this mass form a striking contrast with the vigor and lively green of the rest of the plant. The dormant rootstocks as imported from Africa are to all appearance dead, but when placed upon the ground soon throw out small roots from the lower surface, and stems start from the upper surface and grow very rapidly. When not growing, the plant is kept quite dry. It is called in Africa Hottentots' bread, but it is said that the natives do not eat it, though the fleshy interior of the rootstock affords food to baboons and other animals. One or two other species are known, but are not cultivated.

**TORTOLA**, the most important of the Virgin group of West India islands, belonging to

Great Britain, lying between Virgin Gorda and St. John's, in lat. 18° 24' N., lon. 64° 32' W.; area, 26 sq. m.; pop. about 4,000. It is 12 m. long by 2 to 4 m. broad, and has a rough surface, rising to the height of over 1,600 ft. On the north, at Tortola, the chief town, is an excellent land-locked harbor. It exports sugar, molasses, rum, and copper ore. It is the seat of the lieutenant governor and the administrative council. The climate is unhealthful. (See VIRGIN ISLANDS.)

**TORTOSA** (anc. *Dertosa*), a walled city of Catalonia, Spain, in the province and 41 m. S. W. of the city of Tarragona, on the left bank of the Ebro; pop. about 25,000. It is on the slope of a hill, and is entered by three gates; the streets are narrow, ill paved, and some of them very steep. It has a Gothic cathedral, a theological seminary, and numerous churches and schools. Cotton and linen goods, glass, earthenware, cordage, wax candles, leather, soap, brandy, starch, and baskets are manufactured. The river is navigable for vessels of 100 tons, and there is considerable trade. There are quarries of valuable marble, known as Tortosa jasper, about 3 m. from the city.—The town enjoyed the privilege of a Roman *municipium*. It was early taken by the Moors, but was wrested from them in 811 by Louis le Débonnaire. They afterward retook it, and it became a harbor of pirates. A crusade was proclaimed against it in 1148 by Pope Eugene III., and it was captured. The Moors made desperate efforts to retake it, but the Christian women defended the walls while the men sallied out and put the besiegers to flight. Many privileges were conferred upon the women for their bravery, and in 1170 the military order of La Hacha, or the Flambeau, was instituted for them. The French took Tortosa in 1708, and again at the beginning of 1811.

**TORTUGAS.** I. See DRY TORTUGAS. II. An island of the West Indies, off the N. E. coast of Cuba, from which it is separated only by a narrow channel called El Savinal. It forms the entrance to the harbor of Nuevitas, and is about 25 m. long from N. W. to S. E. and 6 m. wide.—Several smaller islands are called Tortuga or Tortue (Sp. and Fr., a tortoise) from their shape, or from abounding in tortoises.

**TORTURE**, properly, an infliction of severe pain upon an accused person to induce a confession of guilt, or upon a criminal to extort a revelation of his accomplices. The term is frequently used carelessly to designate severe and unusual punishment, inflicted for crime, but improperly, as it is never spoken of by judicial writers as a punishment. By legal writers on the continent of Europe and the earlier English authors, the word *questio* (Lat. *questio*, a seeking) is used as a synonyme of torture; the object being a search for the truth in regard to the criminality of the tortured person, or the names of his accomplices, by the compulsion of suffering. Torture was divided as to intensity into the "question ordinary," a com-

paratively mild application of the instruments used in torturing, and the "question extraordinary," where these means were used to the greatest extent compatible with the preservation of life. The threats of torture were divided into "verbal territion," when the executioner described the torture, and "real territion," when the victim was placed upon the rack but not tortured. As to the time of its application, it was called the "question preparatory" when used for the purpose of compelling the accused to confess his own crime, and the "question préalable or preliminary" when applied to extort from a criminal the revelation of his accomplices.—Torture seems to have been early practised as a means of discovering guilt, both judicially and privately, but was not inflicted on freemen or citizens till the time of the Roman emperors, except in cases of suspected crime against the state itself. The Greeks inflicted it on their slaves, and after their subjugation by the Romans it was inflicted on those who had not a claim to the name of Roman citizen; the oath of the citizen was considered sufficient. Under the emperors this distinction was not long continued, and men and women even of patrician birth were subjected to torture to compel confession of crimes existing only in the imagination of tyrants. Wherever the code of Justinian was adopted as the basis of the legal system of European nations during the middle ages, judicial torture formed a feature of the examination of persons accused of crime; in the Teutonic nations it gradually took the place of ordeals and the trial by battle. In England it was probably never considered a part of the common law, though the *peine forte et dure*, which was used to compel a prisoner to plead to the indictment, had certainly some countenance from that law. (See PEINE FORTE ET DURE.) But it was recognized as one of the prerogatives of the crown to order it, and was thus in occasional use up to 1640, when the last case occurred. Severe and cruel as were the punishments inflicted by the ecclesiastical law, there is no evidence of a resort to "the question" by the inquisition or any other ecclesiastical court before 1252, when Innocent IV. called upon the civil arm to use it to induce confessions and accusations by offenders. Not long after this period the necessity of secrecy in the proceedings of the inquisition led to its extensive adoption, and to refinements of cruelty in its use before unknown. Judicial torture continued in most of the European states till the latter part of the last century. In 1780 the "question preparatory" was discontinued by a decree of Louis XVI., and in 1789 torture in general was abolished throughout the French dominions. In Russia it was abolished in 1801. In Austria, Prussia, and Saxony it was suspended soon after the middle of the last century, but in several of the smaller German states it continued on the statute books till the present century. Thomasius, Hommel, Voltaire, Beccaria, and Howard were instrumental

in bringing about its discontinuance. In the United States torture has never been reckoned an adjunct of judicial examination, though there are traces of the belief in its necessity among the lower classes in some of the early colonial enactments.—Among the Romans, the scourge was the usual instrument of torture; the *equuleus*, a sort of upright rack, was an invention of the Romans used upon their slaves, to which pincers to tear the flesh, fire, &c., were added. The rack as used in the tower of London was of uncertain origin; it consisted of an open frame of oak under which the prisoner was laid on his back, and his wrists and ankles fastened by ropes to rollers at the end of the frame, which were tightened by means of a ratchet wheel till the whole body was brought to a level with the top of the rollers, and in the "question extraordinary" till the joints were dislocated. The "boot" was the favorite French instrument of torture; in this rings of iron were passed around the legs, and wooden wedges driven between them and the flesh till the muscles were reduced to jelly. Among other instruments used to test the power of human endurance were the thumbscrew; iron gauntlets; the "little ease," a narrow cell in which the prisoner was confined for several days, and in which the only position possible was one which soon cramped every muscle; the "scavenger's daughter" (a corruption of "Skevington's daughter"), an instrument invented by Sir William Skevington, which so compressed the body as to start the blood from the nostrils, and often also from the hands and feet; the torture by water; and numerous other inventions capable of producing intense suffering.—For those forms of punishment which aimed at making the penalties of crime terrible by the intensity of the physical suffering they inflicted, ingenuity seemingly exhausted its powers. Crucifixion, fastening to the cross with cords, and anointing the body with honey that insects might torment the helpless victim, hanging up in a cage, suspending the culprit by the arms while weights were tied to the feet, the fastening of limbs to trees which were forced into proximity to each other and then suffered to fly apart, pouring melted lead into the ears, immersing one or more limbs or the whole body in boiling oil, suspending over a slow fire, plucking out the hair in masses, slitting the nostrils and lips, putting out the eyes, cropping, cutting off the hands, branding, mutilation, crushing the body with heavy weights, starvation, deprivation of air, confinement in *oubliettes* or bottle-like prisons without ventilation, pulling out the nails, and breaking on the wheel, are a few of the many means by which punishment has been inflicted, often for offences of a secondary grade, within the past 200 years. To the same writers who effected the discontinuance of torture, is due in a great degree also the abolition of these cruel punishments.—See Jardine, "On the Use of Torture in the Criminal Law of England" (8vo,

London, 1839); Maclaurin, "Introduction to Criminal Trials;" Augustin Nicolas, *Si la torture est un moyen sûr à vérifier les crimes secrets* (12mo, 1681); Reitemaier, *Sur la question chez les Grecs et les Romains*; and Mittermaier, *Das Deutsche Strafverfahren*, vol. i.

TORY. See WHIG AND TORY.

TOSCHI, Paolo, an Italian engraver, born in Parma about 1788, died there in 1854. He studied in Paris, returning in 1819 to Parma as director of the academy of fine arts. He was the first to engrave Correggio's frescoes, of which he completed 22 plates with the aid of his pupils, who continued the work after his death; the whole number is to be 48, and 18 additional had been finished in 1874.

TOTAL ABSTINENCE. As early as 1689 a law was made in Massachusetts to restrain intemperate drinking, and similar laws were passed about the same time in Connecticut. In 1760 the religious societies began to protest against the use of liquors at funerals. In 1756 a duty was laid upon imported spirits in Pennsylvania for the purpose of diminishing their consumption, and in 1772 this act was extended to embrace spirits of domestic production. The first continental congress, in 1774, recommended "the several legislatures of the United States immediately to pass laws the most effectual for putting an immediate stop to the pernicious practice of distilling, by which the most extensive evils are likely to be derived if not quickly prevented." The first modern temperance society was formed in 1789 by 200 farmers of Litchfield, Conn., who, to discourage the use of spirituous liquors, "determined not to use any distilled liquors in doing their farm work the ensuing season." In December, 1790, the college of physicians in Philadelphia memorialized congress "to impose such heavy duties upon distilled spirits as shall be effectual to restrain their intemperate use in our country." The Methodist church from its foundation in America took decided ground against the use and sale of liquors. In the latter part of the 18th century the clergy in general began to make active efforts against intemperance. The cause of temperance was also publicly advocated by philanthropists, chief among whom was Dr. Benjamin Rush. But the modern temperance movement may be said to date from 1811, when the efforts for the suppression of intemperance assumed an organized and systematic form, although for 25 years thereafter but limited results were apparent. In that year the general assembly of the Presbyterian church appointed a committee of seven ministers to devise measures for preventing the evils arising from the intemperate use of spirituous liquors. In 1812 this committee recommended that all Presbyterian ministers in the United States should deliver discourses on the evils of intemperance, and that extended efforts should be made to circulate addresses, sermons, tracts, and other printed matter on this subject. In June, 1811, the

general association of Massachusetts appointed a committee of four ministers and four laymen to coöperate with the committee of the general assembly of the Presbyterian church and the general association of Connecticut in devising measures for the promotion of temperance. In 1813 this committee organized the "Massachusetts Society for the Suppression of Intemperance," which in 1833 changed its name to that of the "Massachusetts Temperance Society," under which title it was incorporated in 1845 and still holds a corporate existence. In 1826 the "American Society for the Promotion of Temperance" was formed in Boston, with Marcus Morton as president. Dr. Justin Edwards of Andover, Mass., became the corresponding secretary in 1829, and travelled extensively, preaching total abstinence and organizing state and local societies. The five annual reports of the society written by him are among the best contributions to the literature of this subject. In 1836 the society became by change of name the "American Temperance Union," with the Rev. Dr. John Marsh as secretary. It was then established in Philadelphia, but in October, 1838, was removed to New York. Although total abstinence was publicly advocated as early as 1820, it was not till many years later that any of the temperance organizations insisted upon this requirement. The object of the Massachusetts society, as set forth in its constitution, was "to discountenance and suppress the too free use of ardent spirits." Neither the American temperance society nor its auxiliaries opposed the use of wine, cider, or malt liquors. Total abstinence from distilled spirits, except when prescribed as a medicine, and moderation in the use of the less intoxicating drinks, were the only general requirements. Many of the earlier advocates of temperance, including Mathew Carey, encouraged the culture of the grape and the use of wine as a preventive of intemperance. Dr. Marsh, in his "Fifty Years' Tribute to the Cause of Temperance," says: "The first reformers built a brewery in Boston for the accommodation of members of the temperance society." Even the first national temperance convention, which assembled in Philadelphia in May, 1833, and was composed of 400 delegates from 21 states, including a large number of clergymen of all denominations, simply took the ground that "the traffic in ardent spirits as a drink, and the use of it as such, are morally wrong, and ought to be abandoned throughout the world." Nothing was said of total abstinence from other alcoholic beverages. At this convention the "United States Temperance Union" was formed, consisting of the officers of the American temperance society of Boston, 23 state societies, and more than 7,000 minor associations. Its object was, by diffusing information and exerting a moral influence, to extend the principles of temperance throughout the world. In 1838 the Massachusetts society adopted a new con-

stitution with a pledge of total abstinence. In 1836 the state society of Pennsylvania, formed in 1827, adopted the pledge of "total abstinence from all that can intoxicate." Demand was now made in all the states that higher ground should be taken; yet few were prepared to include malt liquors in the pledge, believing that beer was necessary and beneficial. The second national convention was held at Saratoga, N. Y., in 1836, when the name of the United States temperance union was changed to that of the "American Temperance Union," with the design of admitting members from all parts of North America. The convention was attended by 848 delegates from 19 states and territories and from Canada. The most marked feature of the proceedings was the adoption of the principle of total abstinence from all intoxicating drinks as beverages. One of the earliest state societies was that of Connecticut, organized in May, 1829. In the same year state temperance societies were formed in New Hampshire, Vermont, New York, Virginia, and Illinois. In May, 1831, there were 19 state societies, with 2,200 known local societies formed on the plan of total abstinence, and embracing more than 170,000 pledged members. In 1832 the war department abolished the "grog" ration, substituting coffee and sugar.—As early as 1832 the license question began to be agitated, and a strong public opinion against license laws was soon formed. In 1837-'8 a bill introduced in the Maine legislature to repeal all license laws of the state, and to forbid the sale of ardent spirits as a beverage in less quantity than 28 gallons, was lost by one vote in the senate. In Tennessee a law was passed repealing all acts licensing tippling houses, and making the retailing of spirits a misdemeanor punishable by fine at the discretion of the courts. In Massachusetts the sale of spirituous liquors in less quantity than 15 gallons, except by physicians and apothecaries, was forbidden. Laws were also passed in Connecticut, Rhode Island, and New Hampshire, either restricting the sale or leaving it to a vote of the people of each town whether liquor selling should be licensed. The third national convention, composed of 560 delegates, assembled in July, 1841, and resolved "that the license laws are at variance with all true political economy, and one of the chief supports of intemperance." Large conventions in Maine, New Hampshire, and Massachusetts declared against granting licenses, and in favor of providing by fine and imprisonment for the effectual suppression of the traffic. In 1846 New York voted against license by a large majority. Vermont gave a majority of 8,000 against license, and many towns in New Hampshire voted against it. In Rhode Island every town but three, and in Connecticut two thirds of the towns, declared in favor of "no license." In Pennsylvania 18 counties voted on the question, and generally against license. In Ohio, Indiana, Michigan, Iowa, and Wis-

consin about half of the counties opposed it. The agitation of the question of license resulted in a strong public sentiment in favor of prohibition. In March, 1847, the supreme court of the United States unanimously decided that prohibitory laws "were not inconsistent with the constitution of the United States, nor with any acts of congress;" and that it was within the police powers of the states to restrain or prohibit the traffic in intoxicating drinks. Maine was the first state to prohibit by law the sale of strong drinks. A prohibitory law was enacted in that state in 1846, with only ordinary fines for its violation. The "Maine law," drafted by Gen. Neal Dow, provided for the seizure and destruction of liquors held for illegal sale; fine and imprisonment for the illegal manufacture or sale of liquors were prescribed in 1861. This law was repealed in 1856, and a stringent license law substituted; but after an experience of two years of license, with increase of poverty, crime, and public disorder, contrasted with the previous years of prohibition, an enactment was passed and submitted to the people, and prohibition again became the policy of the state, being ratified by a majority of 22,952. Delaware was the second state to enact a prohibitory law, which was submitted to the people and ratified in 1847; but in 1848 it was declared unconstitutional by the supreme court for being so submitted. In May, 1852, Rhode Island passed a prohibitory law, which was declared unconstitutional by Judge Curtis of the United States circuit court. It was amended in January, 1853, and was repealed in 1863. In 1865 a law was passed allowing town councils and boards of aldermen to grant or refuse licenses. In 1874 the license clause was repealed, and prohibition reenacted; but in June, 1875, the prohibitory clause was again repealed. Massachusetts passed a prohibitory law in 1852, which was declared unconstitutional in some of its provisions, and a new law was passed in 1855, which remained till 1868, when it was repealed and license substituted; but the prohibitory law was again enacted in 1869, cider being excepted. In 1870 the law was altered to allow the free sale of lager beer, ale, porter, and strong beer, in every town in the state where the citizens did not vote to prohibit it; but in 1871 the law was again changed so that malt liquors might not be sold in towns without a vote in its favor, cider being still exempt. In 1873 the beer clause was repealed, thus restoring the prohibition of both malt and spirituous liquors; but as apothecaries were permitted to sell, the law of 1855 and 1857 was not fully restored. In 1875 the prohibitory clause of the law was repealed, and license substituted. The Vermont legislature in 1852 passed a prohibitory law, which was ratified by the people in 1853, and still remains. In 1850 Michigan prohibited the sale of liquor by a constitutional provision; and in 1853 a prohibitory law was enacted and ratified by a popular

majority of 20,000. In 1854 the law was pronounced unconstitutional by half of the judges of the supreme court, because it had been submitted to the people. The law was reenacted in 1855, and was changed seven times previous to 1875, when the prohibitory law was repealed and a tax law substituted. In 1853 Chief Justice Williams of Connecticut drafted a prohibitory law, which was passed by the legislature, but was vetoed by Governor Seymour. But in 1854 a bill was passed prohibiting the sale of liquors by a vote of 13 to 1 in the senate and 148 to 61 in the house. It was repealed in 1872. A prohibitory law was enacted in Indiana in 1853, with a clause providing for its submission to the people, which the supreme court pronounced unconstitutional. In 1855 another prohibitory law was passed, but it became null because the supreme court was equally divided as to its constitutionality. In Iowa a prohibitory law was passed by the legislature in 1855, and ratified by the people. This law still exists, with some modifications in regard to fermented liquors. The New York legislature passed a strong prohibitory law in 1854, which was vetoed by Governor Seymour. The next year the law was again passed, and its constitutionality was affirmed by the court of appeals in 1856. In New York city the mayor did not attempt to enforce it. New Hampshire passed a prohibitory law in 1855, which is still in force. Illinois also passed a prohibitory law, with a clause providing for submitting it to a vote of the people, by whom it was defeated.—The fourth national convention assembled in 1851 at Saratoga, and passed resolutions in favor of prohibitory laws, and advised that an appeal should be made to the people in states where the legislature would not enact such a law. The fifth convention, held in 1865, recommended the use of unfermented wine by the churches in the communion, deprecated the use of alcoholic liquors as a medicine, and urged the medical profession "to substitute other articles in the place of alcohol as far as in their judgment it can be wisely done." A committee appointed by this convention organized in 1865 the "National Temperance Society and Publication House," which has its headquarters in New York, and is engaged in the publication and distribution of temperance literature. The sixth convention, at Cleveland, Ohio, in 1868, urged the friends of the cause "to refuse to vote for any candidate who denies the application of the just powers of civil government to the suppression of the liquor traffic." The seventh convention, held at Saratoga in 1873, declared "that the time had arrived to introduce the temperance issue into state and national politics," and "to coöperate with existing party organizations where such will indorse the legislative policy of prohibition and nominate candidates pledged to its support, otherwise to organize and maintain separate independent party action." The eighth

national convention was held in Chicago in 1875. It resolved "to nominate and vote for such candidates only, state and national, as will unqualifiedly indorse and sustain the prohibition of the liquor traffic," and "that whenever suitable nominations are not otherwise made, independent prohibition candidates be nominated." Political action was early taken by temperance organizations, many local officers being elected in various states as temperance candidates; and in 1854 the candidate of the temperance party for governor in New York, Myron H. Clark, was supported by the remnant of the whig party, and elected. In 1872 the Hon. James Black of Lancaster, Pa., was nominated for president, and received votes in New Hampshire, Connecticut, New York, Pennsylvania, Ohio, and Michigan.—*Total Abstinence Societies.* The "Washingtonian Temperance Society" was formed in Baltimore, April 5, 1840, by six men of intemperate habits, who signed a pledge of total abstinence with the determination to urge others to do the same. The number of members rapidly increased, and at the first anniversary of the society more than 1,000 reformed drunkards marched in procession. Similar societies were formed in various parts of the United States, and speakers travelled through many states, advocating the cause. It is estimated that 150,000 decidedly intemperate men signed the pledge and gave up drink. The first division of the "Sons of Temperance" was organized in New York city in 1842, by John W. and Isaac Oliver. The order increased with great rapidity, numerous divisions being organized in every state and territory, and in Canada and Great Britain. The strength of the order reached its maximum in 1850, when there were in the United States, Canada, and England 37 grand divisions and 6,097 subordinate divisions, with a total membership of 238,903. In 1873 there were 42 grand and 1,836 subordinate divisions, with 82,299 members; the number of members in Great Britain was 11,116. The basis of the organization is: 1, a strict adherence to the principles of total abstinence from all intoxicating drinks; 2, the payment of regular dues to form a common fund for coöperative temperance agitation, mutual aid in sickness and distress, and funeral expenses. The "Temple of Honor and Temperance" was organized by prominent sons of temperance, and designed as a higher branch of that order. The first temple was instituted in New York city in 1845; a national temple was organized in 1846. In 1848 all connection with the sons of temperance was severed, and the temple of honor assumed an independent position. In 1855 there were 343 temples, with 13,860 members. In 1874 there were 20 grand temples, with 315 subordinate and 110 inner temples, the total membership being 16,923. The order stands firmly by total abstinence as the only rule of personal duty, and prohibition as the true

policy of the state. The "Independent Order of Good Templars" was formed in 1852, on the basis of total abstinence from all intoxicating liquors as a beverage, and the absolute prohibition by law of the manufacture, importation, and sale of intoxicating liquors for beverages. The society has passwords, signs, grips, and signals. There are four degrees: the subordinate degree, degree of fidelity, degree of charity, and grand lodge degree. Each grand lodge is the head or legislative body of the state or territory where it exists, and is composed of representatives from the subordinate lodges within the jurisdiction. The grand lodges meet annually and elect representatives to form the right worthy grand lodge, whose province is to legislate upon all matters of general interest to the whole order. In 1875 there were 60 grand lodges within the jurisdiction of the order; there are grand lodges in Great Britain, Canada, Australia, and elsewhere, besides subordinate lodges in China, India, Japan, France, Germany, Holland, Portugal, Africa, and the West Indies. The total membership is estimated at 785,000. In England, where the order has its greatest numerical strength, there are 3,618 lodges, with 166,708 members.—*Great Britain.* The temperance movement in Great Britain was begun by John Dunlop, a justice of the peace for Renfrewshire, who devoted himself to the cause in Scotland in 1828, and in 1829 formed the first temperance society near Glasgow. The first total abstinence society was organized at Dunfermline in 1830. In Ireland the cause was first advocated by the Rev. George Whitmore Carr, who organized a society at New Ross, county Wexford, in 1829. The first total abstinence society was formed at Strabane in 1835. Father Theobald Mathew began his labors at Cork in 1838, and soon extended them not only to all parts of Ireland, but to England and Scotland. The total abstinence society formed by him in 1838 contained 1,800,000 members in 1840. The consumption of whiskey in Ireland decreased from 12,500,000 gallons in 1838 to 6,500,000 gallons in 1841. In 1843 the number of persons pledged to total abstinence exceeded 5,000,000. The active movement against intemperance in England began in 1830, when the first society was formed at Bradford by Henry Forbes, a merchant. Other societies were organized during the same year at Warrington, Manchester, Liverpool, and Leeds; and in 1831 the "British and Foreign Temperance Society" was formed, with a pledge "to abstain from distilled spirits except for medicinal purposes." This society, which had for its patron the bishop of London, and among its vice presidents bishops, admirals, and other persons of high official rank, held for many years a prominent place in the temperance movement. At first these societies did not oppose the moderate use of wine and malt liquors. The first total abstinence society in England was formed at Preston in 1832.

In 1885 it was estimated that 48,000 persons had signed the pledge in England, and that 2,000 drunkards had been reformed. In 1885 the "British Association for the Promotion of Temperance" was formed in Manchester, on the principle of total abstinence, and the "British Teetotal Temperance Society" in London; in 1886 the latter was united with the "New British and Foreign Temperance Society for the Suppression of Intemperance."

Weekly meetings were held in various parts of London, with great success. The moderation movement finally died out, and "teetotalism" was firmly established as the best means of suppressing intemperance. Up to 1889 the new British and foreign society had two pledges; in that year the American pledge of total abstinence was adopted. In 1840 the two general societies adopted the principle of total abstinence, and the cause spread rapidly throughout the United Kingdom. At this time about 500,000 members were enrolled in the societies of Great Britain, while the adherents to total abstinence numbered more than 2,000,000. In 1842 the two parent societies in London were dissolved, and the "National Temperance Society" was organized, which recognized all total abstinence societies, of whatever form of pledge. In 1843 Father Mathew visited London, and in six weeks administered the pledge to about 70,000 persons. In August, 1846, a world's temperance convention was held in London, and was attended by 300 delegates, including 25 from North America. The most marked progress was made by the temperance cause from 1851 to 1856. The "London Temperance League" held monthly meetings in Exeter hall, and free lectures were delivered in all parts of the city; 8,000 petitions were sent to parliament, and 80,000 tracts distributed. The "United Kingdom Alliance" was formed in 1853 for the "total and immediate suppression of the traffic in all intoxicating liquors as a beverage;" it has since prosecuted its labors with great vigor and success by means of lectures, petitions to parliament, publications, &c. The alliance has given its hearty support to the "permissive bill," which has often been brought forward in parliament in recent years, but without success. The object of the bill is to prohibit the granting of licenses to sell liquor whenever two thirds of the rate payers of any parish shall by vote so determine. Numerous organizations are now actively engaged in various parts of Great Britain in promoting the cause of temperance. Chief among these are: the "National Temperance League," formed in 1854 by a union of the national temperance society with the London temperance league; the "British Temperance League," whose operations are chiefly in Lancashire and Yorkshire, its headquarters being at Bolton; the "Western Temperance League," established in 1887 and reorganized in 1888, embracing 284 societies, the operations of which extend to nine English and

three Welsh counties; the "North of England Temperance League," with 125 societies in Northumberland, Durham, Cumberland, Westmoreland, and the Cleveland district of Yorkshire; the "Irish Temperance League;" and the "Scottish Temperance League," which in 1873 had issued 70,000 volumes and 680,000 tracts, besides a weekly and a monthly periodical. The United Kingdom alliance has its executive council resident in Manchester. England and Wales are divided into districts superintended by resident agents. Its operations also extend to Scotland and Ireland in connection with the "Scottish Temperance and Permissive Bill Association," the "Irish Temperance and Permissive Bill League," and the "Irish Permissive Bill Association." The "National Association for promoting Amendment in the Laws relating to the Liquor Traffic" directs its efforts toward obtaining amendments of license laws. Various enactments have been passed by parliament, and committees of inquiry appointed with the view of diminishing the evils of intemperance. These efforts have been directed toward the restriction of the liquor traffic rather than its prohibition.

**TOTILA** (properly *BADUILA*), a Gothic king of Italy, died A. D. 552. He was duke of Friuli, and was chosen king in 541, after the surrender of Vitiges to the Byzantine forces at Ravenna. When Belisarius was withdrawn from the service against the Goths, Totila overran the greater part of Italy, and in 546 entered Rome by the treachery of some Isaurian sentries. He held peaceful possession of the city until compelled to leave it in order to repair the reverses his armies had sustained in Lucania. In his absence Rome was recovered by Belisarius, and in 547 Totila was repulsed in endeavoring to retake it. In 548 Belisarius was recalled to Constantinople, and Rome once more fell into the hands of Totila. In 552 Narses was sent into Italy by the emperor Justinian, and at Tagina in Umbria Totila's forces were defeated, and he was killed.

**TOUCAN**, a name given to the scansorial birds of the family *ramphastidae*, derived from the Brazilian imitation of their note. The family is remarkable for the disproportionate size of the bill, which is very light on account of its spongy texture; it is strengthened internally by a network of thin bony laminae freely supplied with vessels and nerves; it is broad at the base, without a cere, smooth, with the culmen curved, sides compressed, tip hooked, and the sides serrated; the tongue is long and slender, provided with numerous barbs on each side directed forward; the bill is usually adorned with bright colors, which fade after death; the tarsi covered with transverse scutes, the quills almost concealed under the large coverts, the tail with ten feathers; claws curved and sharp; toes two before and two behind; orbital region naked; furcula of two bony pieces, thin and not united below, and sternum with two deep incisions on each side

behind. They are peculiar to tropical America, living in flocks in the forest, where they make a great chattering as they hop from branch to branch in search of food; they feed principally on pulpy fruits, also on fish, eggs, larvæ, and small birds and reptiles; they also saw off the tubular corolla of flowers, picking out the insects with the horny, fimbriated tongue. When roosting they throw their tail upward and forward, and rest the enormous bill on the back. They are generally handsome birds, representing in America the hornbills of Asia and Africa; they are not powerful fliers, and are strictly arboreal, hopping among the branches with such grace and agility as to have suggested for one of them the specific name of Ariel. The nest is in holes in trees, and the eggs are two, rounded and white. They post a sentinel while they feed, whose warning cry resembles the word *tucano*; the skin is bluish, and the flesh eatable though rather tough; they sometimes commit great havoc with fruit, and are often killed for food and for their brilliant feathers; they are very sensitive to cold.—In the toucans proper (*ramphastos*, Linn.) the bill is higher and wider than the forehead, looking as if too large for the head and belonging to another bird; the nostrils are hidden behind the prominent base; wings short and rounded, with the first four quills graduated and narrowed at the tip, and the fifth the longest; tail short and nearly even; feet short and stout; colors generally black with patches of white, red, and yellow, especially under the chin. The toco toucan (*R. toco*, Gmel.) is 17 in. long, and the bill is more than half of that length; plumage black with throat and rump white, vent red, bill orange red with black tip; it inhabits Guiana and Brazil. The yellow-breasted toucan (*R. tucanus*, Linn.) has a yellow throat, with red

Yellow Toucan (*Pteroglossus Humboldtii*).

vent and breast spot, and the rest of the plumage black. There are more than a dozen other species.—In the genus *pteroglossus* (Illig.), generally called aracarís, the bill is much small-

er and sometimes not out of proportion to the head, as high as the forehead, with the nostrils conspicuous at the base; fourth, fifth, and sixth quills longest; tail long and graduated; the colors are usually green, with red or yellow on the breast. There are more than 30 species, with habits similar to those of the last genus. The aracarí toucan (*P. aracarí*, Illig.) is 17 in. long, with a bill of 4 in.; plumage blackish green, with yellowish abdomen, red median abdominal bar and rump; upper mandible with a longitudinal black stripe. The yellow toucan (*P. Humboldtii*, Gould) is 17 in. long, black and olive with a scarlet rump, and the under surface yellow; it is found on the upper Amazon.—For description and figures of this family, see Gould's "Monograph of the Ramphastidae" (fol., London, 1834).

**TOUCH**, the modification of the common sensibility of the body, especially seated in the skin, by which through physical contact we obtain an idea of resistance or weight, temperature, size, shape, smoothness or roughness, &c. It is most acute at the tips of the fingers, on the tongue, lips, portions of the mucous membrane, and the nipples, where the sensory papillæ are the most numerous, each one receiving one or more nerve fibres. The nerve fibres appear to terminate in what has been called the tactile corpuscle in the interior of the papilla. All the afferent nerves of the general integument apparently minister to the sense of touch, by virtue of their connection with the seat of common sensation in the brain; those of the lower extremities are less concerned in conveying sensations than those of the upper, though they are far more efficient in exciting the reflex action of the spinal cord. The acuteness of touch differs in various parts of the body, generally in proportion to their vascularity; the non-vascular parts, like the hair, nails, and teeth, have no sense of touch, while on the skin the nerves are spread in a minute network. Its relative acuteness has been measured by Weber, by placing the legs of a pair of compasses on the skin, and approximating them until brought within the smallest distance at which they could be felt as distinct points, and with the following results: the point of the tongue,  $\frac{1}{4}$  line; palmar surface of third finger, 1 line; red surface of lips, 2 lines; tip of nose, 3 lines; edge of dorsum of tongue, 4 lines; skin of cheek, palm of hand, and end of great toe, 5 lines; back of hand, 8 to 14 lines; back of foot, 18 lines; over spine, and in middle of arm and thigh, 80 lines. There are considerable variations in this respect in different individuals. The feeling of tickling is most easily excited in parts having a feeble sense of touch, as the arm pits, sides below the ribs, palms, and soles, while the sensitive points of the fingers cannot thus be affected. This sense is exceedingly acute in the flying membrane of the bats and in the whiskers of the carnivora and rodents. It is combined with movement in the human hand, with its power

of pronation and supination, opposability of the thumb, and great mobility of the fingers. The power of distinguishing the temperature of foreign bodies is restricted within certain rather narrow limits. We can perceive the temperature of a substance which is moderately warm or cool; but if it be either above or below a certain limit, we fail to judge accurately of its temperature, and receive only a painful sensation. If the foreign body be excessively hot or cold, as in the case of boiling water or frozen mercury, the discrimination of temperature is lost altogether, and the painful sensation is the same in either instance. Thus the touch of a very cold conducting body may be said to burn the fingers, like that of a very hot one. Cold, by retarding the capillary circulation and by its direct sedative influence, deadens the sense of touch; in like manner, pressure upon or disease of the nerve trunks, and various states of the brain receiving the sensory impressions, are accompanied by obtuseness of touch. Prominent among the causes acting on the nervous centres are the influence of toxic and anæsthetic agents, obstructed circulation, and chronic inflammations; on the other hand, irritation and acute inflammation in the course of the nerves, at their peripheral terminations, or in the centres, may be accompanied by hyperæsthesia or excessive sensitiveness of the surface. Subjective sensations, or those dependent on internal causes, are very common in the sense of touch; those of pleasure and pain, heat and cold, itching and creeping sensations, &c., are familiar examples. Touch may be greatly improved when the other senses are impaired or lost, partly from the greater attention given to the sensations, and the consequent increase of the power of discrimination. Instances of the education of this sense are very remarkable and well known in the blind. In the lower animals it is most acute in the hands, feet, and prehensile tail of monkeys; in the lips and tongue of herbivora; in the snout of the elephant, pig, tapir, and mole; in the flying membrane, ears, and nasal appendages of bats, which can perceive even the vibrations of air; in birds, in the under surface of the toes and their webs, and in the sensitive skin of the mandibles of the duck tribe and some waders; in the under surface of the toes in many lizards, in the extensible tongue of the chameleon and serpents, in the naked skin of batrachians, and in the thumbs of the males of the latter during the reproductive season; in the antennæ and palpi of articulates, in the oral appendages of mollusks, and in the tentacles of radiates.

**TOUL** (anc. *Tullum*), a fortified town of French Lorraine, in the department of Meurthe-et-Moselle, on the Moselle, 14 m. W. of Nancy; pop. in 1872, 6,584. It has a celebrated Gothic cathedral, and other notable buildings are the church of St. Genoult and the former episcopal palace, now used as a town hall. Its trade and industry embrace wine, glass, hosiery, and other

local products and manufactures.—Originally it belonged to Belgic Gaul, and afterward successively to Austrasia, to local counts, and to Germany as an imperial city under the protectorate of the dukes of Lorraine; and in the middle of the 16th century it was annexed to France. The bishopric, established early in the 5th century, was suppressed during the revolution. In January, 1814, Toul was stormed by the Russians; and in 1870 it was bombarded by the Germans, to whom it surrendered Sept. 23, after a strenuous defence.

**TOULMIN, Camilla.** See **CROSLAND**.

**TOULMIN, Joshua**, an English clergyman, born in London, May 11, 1740, died in Birmingham, July 23, 1815. He was educated at a dissenting academy, and became pastor of a dissenting congregation in Colyton, and in 1765 of a Baptist congregation in Taunton, where he was also a bookseller. He subsequently adopted Unitarian opinions, received the degree of D. D. from Harvard college in 1794, and in 1804 was chosen one of the ministers of the Unitarian congregation at Birmingham, formerly presided over by Dr. Priestley, which post he retained till his death. His principal publications are: "Sermons to Youth" (12mo, Honiton, 1770); "Memoirs of Socinus" (1777); "Letter to Dr. John Sturges on the Church Establishment" (1782); "Dissertations on the Internal Evidences of Christianity" (1785); "Review of the Life, Character, and Writings of John Biddle, M.A." (1789); an edition of Neal's "History of the Puritans," with notes and additions (5 vols., 1794-'7; 8 vols., 1837); "Biographical Tribute to the Memory of Dr. Priestley" (1804); "Memoirs of the Rev. Samuel Bourne" (1809); and a "Historical View of the State of the Protestant Dissenters in England" (1814). Theophilus Browne edited and published 22 of his posthumous discourses (8vo, Birmingham, 1818).

**TOULON**, a seaport city of France, in the department of Var, Provence, at the head of a double bay of the Mediterranean, in lat. 43° 7' N., lon. 5° 56' E., 30 m. S. E. of Marseilles; pop. in 1872, 69,127. It stands upon ground which rises gradually from the sea, and is sheltered by a ridge of mountains, extending round the bay. A tongue of land stretches nearly across the entrance of the bay, and, together with all the adjacent points, is strongly fortified. The city has been much enlarged within the last generation, and the new northern quarter is a great improvement upon the old parts of the town. It is especially rich in fountains, trees, and promenades. The cathedral and other old and new churches, the fine town hall, the military and naval schools, as well as the new palace of justice and the new theatre, are all eclipsed by the magnitude of the military port. It is the largest in the Mediterranean and one of the most admirable of the kind, extending over 240 acres, and surrounded by vast buildings, the arsenal, and floating docks, and connected with the supplementary arsenals of Cas-

tigneau and Mourillon; and it contains a bagnio for prisoners sentenced to transportation. The adjoining commercial port is bounded by a quay, which is the most active part of Tou-

lon. Ship building is largely carried on, but trade and industry are chiefly supported by the military and naval works, which employ 10,000 men.—Toulon was known as a harbor

Toulon.

under the Romans, then called Telo Martius. In the middle ages it suffered from the Saracens. The fortifications were first projected as a defence against pirates. Under Louis XIV. they became celebrated, withstanding in 1707 a combined attack by the English and Dutch fleets and a land army under Prince Eugene; and they were extended under Napoleon III. In 1798 the English gained possession of Toulon, but were besieged by the troops of the convention, and finally driven out (Dec. 19), under the direction of Bonaparte, who first established his reputation on this occasion. In revenge for the previous surrender of the royalist inhabitants to a foreign power, the town was given up to pillage and massacre.

**TOULOUSE** (anc. *Tolosā*), a city of France, in Languedoc, capital of the department of Haute-Garonne, on the Garonne, 130 m. S. E. of Bordeaux; pop. in 1872, 124,852. It includes an island in the river, and the suburb of St. Cyprien, where 25,000 workmen resided before its destruction by the floods of 1875. It is more remarkable for historical associations and for its active industry than for external attractions. The square is called after the capitol or town hall, where the once famous floral games are still annually held under the auspices of a literary society. The church of St. Sernin is more remarkable than the cathedral, and is a masterpiece of Romanesque architecture, recently restored by Viollet-Leduc. The church of the Cordeliers, of the 18th century, was destroyed by fire in 1871. Toulouse has one of the richest museums of art, located in a former monastery, and various learned institutions, a public library of 60,000 volumes, an observatory, and an arsenal. The palace of justice was formerly the seat of the Toulouse parliament. The trade with both the Mediterranean and the Atlantic is active. Woollen and cotton goods, cutlery, hardware, and many other articles are manufactured.—Toulouse is of great

antiquity. It became the capital of the Visigoths in the 5th century, and subsequently of the duchy of Aquitaine. Local counts or dukes were the rulers from the end of the 8th till late in the 18th century, in the early part of

Church of St. Sernin.

which a crusade was carried on against Counts Raymond VI. and Raymond VII. (See *ALBIGENSES*.) Philip III. annexed it to the French crown, under which it remained the capital of Languedoc till the revolution. During the mid-

dle ages it was the seat of numerous councils. The memorable battle of Toulouse, April 10, 1814, resulted in Wellington's signal victory over the French under Soult. The inundation of the Garonne on June 24, 1875, caused the loss of a vast number of lives and immense property.

**TOURAINÉ**, an ancient province of France, now chiefly comprised in the department of Indre-et-Loire. It was originally inhabited by the Turones, a Gallic tribe. At the end of the 5th century Clovis took it from the Visigoths. Having been governed for a time by local counts, it passed in 1044 to the house of Anjou, and with this subsequently under English domination. In 1202 it was taken by the French king Philip Augustus. It was a duchy from 1356 till its final annexation in 1584 to the French crown. Tours was at all times the capital of Touraine. (See **INDRE-ET-LOIRE**.)

**TOURCOING**, a town of France, in the department of Le Nord, 8 m. N. E. of Lille, within a few miles of the Belgian frontier; pop. in 1872, 43,322. It contains hundreds of manufacturing of woollens, cottons, linens, carpets, and other goods. The aggregate annual value of trade and industry is estimated at 170,000,000 francs. A pyramid commemorates the battle of May 18, 1794, in which the army of Pichegru defeated the English.

**TOURMALINE**, a name applied to a group of rhombohedral double silicates, composed of silica, fluorine, boric acid, alumina, manganic, ferric, and ferrous oxides, magnesia, lime, soda, potash, lithia, and sometimes phosphoric acid. Rammelsberg divides them into magnesium, magnesium-iron, iron, iron-manganese, and manganese tourmalines, the last two varieties alone containing lithia. The sesquioxides are alumina and ferric and manganic oxides. The color of tourmalines varies with their composition; the red, called rubellite, are manganese tourmalines, containing lithium and manganese, with little or no iron; the violet blue (called indicolite) and green are iron-manganese tourmalines; and the black, which are schorl, are either iron or magnesium-iron tourmalines. White or colorless tourmalines, which are rare, are called achroite. Sometimes the crystals are red at one extremity and green at the other, or green internally and red externally, or *vice versa*. Tourmaline is usually found in granite, gneiss, and syenite, in mica, chloritic, and talcose schists, in dolomite, granular limestone, and sometimes sandstone near dikes of igneous rocks (Dana). Rubellite and green tourmaline are found at Yekaterinburg in the Ural mountains; pink crystals in the island of Elba; pale yellowish brown in Carinthia; white in the St. Gothard mountains, the Ural, and Elba. In Massachusetts, at Chesterfield, are red, green, and blue tourmalines, in a granite vein with albite; and at Goshen the blue occurs in great perfection. At Grafton and Orford, N. H., Brattleboro, Vt., and Monroe, Conn., specimens of tourmaline of various colors occur in steatite, mica slate, and other

rocks. Tourmalines are found in New York, at Crown Point, in fine brown crystals, and in St. Lawrence, Jefferson, Essex, and other counties; also in other states, in numerous localities. In California black crystals, 6 to 8 in. in diameter, occur in feldspar veins in the mountains between San Diego and the Colorado desert. In Canada, superb greenish yellow crystals an inch in diameter occur in limestone at Grand Calumet island. In the town of Paris, Maine, in one of the spurs of "Streaked mountain" called by the mineralogists Mt. Mica, several deposits of beautiful green and red tourmalines of perfect forms were found in 1820 by Elijah L. Hamlin and Ezekiel Jones. Many specimens were sent to various parts of Europe; and some fine ones obtained from Vander Null, an antiquary, are believed to be in the museum at Vienna.—Tourmalines are not often used in jewelry, although fine rubellites form beautiful gems, and bear a high price. In the grand duke's collection at Florence there was a specimen 11 in. square, with four erect green tourmalines and one prostrate, 4, 2, and 2½ in. long and ¼ in. to 1 in. thick. A magnificent group of pink tourmalines nearly a foot square was given by the king of Burmah to Col. Sykes, while commissioner to his court. The tourmaline appears to have been first brought to Europe from Ceylon by the Dutch about the end of the 17th century, and was exhibited as a curiosity on account of its pyro-electric properties, whence it was called *aschentrecker* (Ger. *Aschensieher*). The tourmaline is a double-refracting crystal, but has the peculiar property of polarizing light. It has not the power like Iceland spar of separating and transmitting both the ordinary and the extraordinary ray; but when the plate is cut with its faces parallel to the optic axis of the crystal, and exposed to a ray of light, the ordinary ray passes through, while the extraordinary ray is absorbed. (See **LIGHT**, vol. x., pp. 446 and 449, and **THERMO-ELECTRICITY**.)—See "Diamonds and Precious Stones," by Harry Emanuel (London, 1867; New York, 1873); "The Tourmaline," by A. C. Hamlin, M. D. (Boston, 1873); and Dana's "Mineralogy."

**TOURNAMENT** (It. *torneo*; Fr. *tourner*, to turn), a military sport of the middle ages. It took its rise after the establishment of the feudal system, and appears to have been introduced into northern Europe as early as the middle of the 9th century, although several centuries elapsed before it came into familiar or reputable use. This was owing perhaps to the costliness as well as the sanguinary character of the contests in the early tournaments, which often resulted in the death or serious injury of several of the combatants, and were conducted very much in the spirit of the gladiatorial shows of the ancient Romans. Hence the prohibition of the practice by such princes as Henry II. of England, and the steady opposition of the church down to a late period.

With the institution of chivalry and knight-hood, however, the tournament lost many of its objectionable features; and as an incentive to martial exploits and to a generous emulation in all knightly offices, it began during the period of the crusades to be tolerated, and eventually was encouraged in most countries of Christendom. The church, which had prohibited persons from engaging in tournaments on pain of excommunication, and had denied Christian burial to such as lost their lives in them, finally relaxed its opposition, and until the latter part of the 15th century the sport continued in full activity. It thenceforth became gradually transformed into a court pageant, often of the most magnificent and costly description; but the death of Henry II. of France of a wound received at a tournament in 1559 occasioned its abolition in all parts of Europe, although for nearly a century later it continued to be occasionally revived at court festivities. The decay of chivalry, the introduction of firearms, and the gradual disuse of defensive armor, together with the rise of the commercial spirit and the new civilization thereby extended over the world, were the real causes of its decline. Whatever may have been the nature of the combats in tournaments at the origin of the practice, they soon became for the most part encounters between mounted adversaries (whence the derivation of the term, as illustrative of the agility required by the combatants in turning or managing their horses), who were knights or at least candidates for knighthood, as esquires or pages. A joust was, properly speaking, a combat between two knights, while the tournament included several jousts, or an encounter of several knights on a side.—In the course of time numerous regulations, having the authority of a code of laws, prescribed the manner in which tournaments should be conducted; and, except where national pride or rivalry, or personal enmity, inflamed the combatants, no serious result was likely to happen. They were generally held at the invitation of some prince upon the birth or nuptials of royal persons, during royal progresses, or at high court festivals, and heralds were sent into the neighboring kingdoms to invite the knights to be present. These frequently came from distant countries, attended by splendid retinues; and on the appointed day the galleries encircling the lists, or level enclosed space in which the knights contended, were gay with banners and costly draperies and crowded with spectators, conspicuous among whom were the ladies, whose approving smiles were the rewards most esteemed by the victors. In the flourishing period of tournaments two kinds of arms were employed, those made expressly for the purpose, consisting of lances with the points blunted or covered with pieces of wood, called rockets, and swords blunted or rebated; and those ordinarily used in warfare, termed *armes à outrance*, which in many cases were

not permitted by the judges of the tournament. The blows, whether of lance or sword, were required to be directed at the head and breast, and no combatant was permitted to strike an adversary after he had raised his visor, or to wound his horse. Each knight in attendance was obliged to prove his noble birth and rank, which were originally proclaimed by the heralds with sound of trumpet; whence the word blazonry, signifying the art of deciphering the heraldic devices on a coat of arms, from the German *blasen*, to blow. At a later period the emblazoned shields of the knights, suspended at the barriers or entrance of the lists, sufficed to indicate their rank and family. If upon the accusation of any lady present the bravery or loyalty of a knight was impeached, he was excluded by the heralds from the contest. The heralds having proclaimed the laws of the tournament, at the sound of the trumpet the whole body of knights, each with his attendant squire, entered the lists in a glittering cavalcade, distinguishable only by their emblazoned shields or by the favors of their mistresses suspended from their crests, after which the martial exercises of the tournament began. At the word of the heralds, *Laissez-aller*, the opposing combatants rode at each other in full career, striving to direct their lances fairly upon the helmet or shield of their adversaries, that one being adjudged the victor who broke most spears "as they ought to be broken," who held his seat the longest, and who showed most endurance in keeping his visor closed. Sometimes dismounted knights encountered each other with swords or axes. The prizes were announced by the judges, selected from the older knights, but were awarded by ladies.—A favorite form of the tournament was the so-called passage of arms, in which a party of knights, assuming the office of challengers, offered combat to all who dared oppose them. Of this, as also of the *mêlée* or encounter of bodies of knights attended by their squires, a splendid description is given in Scott's "Ivanhoe." The later tournaments were comparatively harmless.

**TOURNAY**, or **Tournai** (Flem. *Doornick*), a town of Belgium, in the province of Hainault, on both banks of the Scheldt, 45 m. S. W. of Brussels; pop. in 1870, 81,003. It has seven suburbs, fine streets and quays, a gymnasium, an episcopal seminary, an art academy, and many churches, including a cathedral with five towers and fine paintings. The church of St. Brice contains the tomb of Childeric I., and the "golden bees," supposed to have belonged to his royal robes, which Napoleon substituted for the *fleurs de lis* of the Bourbon vestments. Carpets, woollen cloths, hosiery, and linens are manufactured.—Under the Romans Tournay was included in Gallia Belgica under the name of Turnacum or Tornacum. In the 5th and 6th centuries it was a residence of the Merovingian dynasty. It afterward successively belonged to Flanders and France. In 1526 it was annexed to the Spanish Netherlands, and,

having espoused the Protestant cause, it was heroically though unsuccessfully defended in 1581 by Marie de Lalaing, princess of Épinoy, against the duke of Parma. It was conquered by Louis XIV. in 1667, and fortified by Vauban. The treaty of Utrecht (1713) gave it to Austria, but it was again under French rule from 1745 to 1748. The fortifications have recently been demolished.

**TOURNEFORT, Joseph Pittou de**, a French botanist, born in Aix, June 5, 1656, died in Paris near the close of 1708. After extensive studies and explorations he became in 1688 professor at the *jardin des plantes*, and was admitted to the academy of sciences in 1692. In 1700 he was sent by Louis XIV. on a scientific expedition to the Levant. He returned in 1702, and was subsequently professor of medicine in the collège de France. Linnæus has preserved several of his classifications. His works include *Éléments de botanique* (3 vols., Paris, 1694; new ed. of his Latin translation, with A. de Jussieu's additions, including his *corollarium* or classification of his vast collections, 8 vols., Lyons, 1719; English translation, 2 vols., London, 1719-'80); *Histoire des plantes qui naissent aux environs de Paris, avec leurs usages dans la médecine* (1698; enlarged ed. by Jussieu, 2 vols., 1725; English translation by Martyn, 2 vols., London, 1732); and *Voyage du Levant* (2 vols., 1717; English, 8 vols., 1741).

**TOURS** (anc. *Civitas Turonum* and *Cæsardunum*), a city of France, capital of the department of Indre-et-Loire, chiefly on a tongue of land between the Loire and the Cher, 120 m. S. W. of Paris; pop. in 1872, 48,368. The bridge over the Loire is one of the finest in France. A handsome street traverses the town, and contains a marble statue of Descartes, who was born near Tours. Only two towers remain of the celebrated cathedral of St. Martin of Tours, destroyed in 1793. The palace of the resident archbishop is of uncommon beauty. The town hall has a large public library and remarkable manuscripts. Cloth, carpets, silks, and many other articles are manufactured.—Tours was the capital of the ancient tribe of Turones, under the Roman emperors of the latest period of Gallia Lugdunensis III., and lastly of Touraine. A number of important councils were held here, and the states general of France were repeatedly assembled here in the 15th and 16th centuries. The silk industry first arose here, and was of vast extent until the rise of Lyons. The town had a population of nearly 80,000 at the time of the revocation of the edict of Nantes, which ruined its prosperity. Several members of the government of the national defence, including Gambetta, had their seat in Tours during the siege of Paris, till Dec. 10, 1870, when they removed to Bordeaux. The Germans finally occupied Tours, Jan. 19, 1871.

**TOURVILLE, Anne Hilarion de Cotenin**, count de, a French admiral, born Nov. 24, 1642, died

in Paris, May 28, 1701. After brilliant exploits against the pirates of N. Africa, which won for him from Venice the title of protector of commerce, Louis XIV. appointed him in 1667 naval commander. In 1676 he decided the victory of Agosta, and in 1677, off Palermo, he nearly destroyed the allied squadrons of Spain and Holland. After various other achievements he became in 1689 vice admiral of the Levant. In 1690, operating against the English and Dutch off Beachy Head, he pursued the former to the mouth of the Thames, where he destroyed many of their ships and transports. In 1691, as commander of the ocean fleet, he enabled the French troops to reach Ireland in aid of James II. In 1692, by positive order from Louis XIV., at the head of 44 ships, he engaged off the fort of La Hogue, on the E. coast of Cotentin, the English admiral Russell, whose forces were nearly double, and, after 12 hours of determined resistance, was defeated, but escaped to port with the remains of his fleet. In 1698 he was appointed marshal, and in the same year he captured 27 Dutch and English ships off Cape St. Vincent and destroyed 59. He retired after the peace of Ryswick in 1697.

**TOUSSAINT, François Dominique**, surnamed l'Ouvreur, a Haytian general, born near Cap François in 1748, died in the dungeon of Joux, France, April 27, 1808. His parents were both slaves, and of pure negro blood. He was a coachman, and afterward held a post of trust in connection with the sugar manufactory of the estate to which he belonged. He had learned to read and write from a fellow slave, and after his promotion he read considerably. He remained apparently contented with his lot till 1791, when the mulattoes appealed to the negroes for help in enforcing their rights; and even then, though many of the blacks rose in insurrection, Toussaint incurred the hostility of his race by remaining quiet. But after securing the escape of the director of the estate and his family, he joined the negro army. Toussaint, at first employed in a medical capacity, was soon appointed a brigadier general. When news came of the beheading of Louis XVI. the black leaders accepted the aid of Spain, and repelled the offers of the French convention. Toussaint soon captured the entire army of Brandicourt, the general of the whites, without bloodshed, and occupied several important military posts, among them Gonaives. The English, having in 1793 invaded the island, took Port-au-Prince, while the French, the Spaniards, the mulattoes, and the blacks were all contending with each other. At this juncture Toussaint, who was already in effect the commander-in-chief of the black forces, became convinced that the only hope for Hayti lay in declaring for France, whose national legislature, while making Hayti an integral part of France, had proclaimed also the freedom of the slaves. He therefore declared his fealty to the repub-

lic, and applied himself so energetically to bring all parties to the same conclusion that Laveaux, the French commander, exclaimed: *Mais cet homme fait ouverture partout*; and from this time he received his surname of "L'Ouverture" (the opening). He formed a junction with Laveaux, and, though the Spanish and English forces united against him, he drove the English from nearly all their strong positions, took 28 Spanish batteries in four days, maintained a long line of defences against the allied enemy, who possessed twice his force, rescued Laveaux, and finally closed the campaign by receiving the capitulation of the entire English force besieged at St. Marc (1797), and the abandonment of the effort by the Spanish to conquer the W. portion of the island. Toussaint, who had been appointed commander-in-chief of St. Domingo in 1796 by Sonthonax, the French commissioner, soon restored order and industry to the island, though opposed to Hédouville, the new commissioner. Hédouville, finding himself without influence, fled to France to make complaint of the negro chieftain, who sent to the directory a statement of the true position of affairs. The French directory justified Toussaint and censured Hédouville. But the latter, on the eve of leaving Hayti, had sown the seeds of discord between Rigaud, the mulatto leader, and Toussaint, and, by finally setting the former free from his obligations to the latter, had prepared the foundations of a new civil war; and for nearly the whole of the year 1799 the war between the blacks and the mixed race raged fiercely. Toussaint captured Jacmel, subdued the mulatto insurrection, and on Nov. 26, 1800, assumed the government, amenable for his administration to the French directory alone; and in January, 1801, the whole island became subject to his sway. He invited the steward of his old master's estate and other well disposed white colonists back to the island. He assumed great state in his public appearance, being richly attired and surrounded by a guard of 1,500 to 1,800 men, all in brilliant uniforms and admirably mounted; but in private life he was plain and temperate. At the very beginning of his administration Toussaint selected an administrative council of nine, of whom eight were white proprietors and one a mulatto. A constitution was drawn up by the council, in which he was named president for life, and free trade was established. This constitution he sent with a letter to Bonaparte, then first consul, whose reply was: "He is a revolted slave whom we must punish; the honor of France is outraged." An act was passed restoring the French colonies to their condition previous to 1789. In a subsequent decree by Bonaparte St. Domingo or Hayti was excepted—an exception, as the event proved, intended to be only temporary. Gen. Leclerc, the husband of Pauline, Bonaparte's sister, was sent out with a force of 30,000 men and 66 war vessels. The expedition arrived on the

coast of Hayti in January, 1802. Among those in command in it were Rigaud, Pétion, and Boyer, all enemies of Toussaint. Without a declaration of war Leclerc attempted to enter Cap François with his force, and Christophe, who was in command there, rather than surrender, burned the city. Finding unexpected resistance at all points, Leclerc sent Toussaint's sons, who had been educated in France, and whom he had brought with him, to their father, with a letter from Bonaparte and another from himself, couched in terms of mingled flattery and menace. The negotiation was ineffectual. Leclerc then declared Toussaint and his generals outlaws, and a sanguinary conflict ensued, in which one third of the French troops were killed or wounded; and though they possessed the seaports, yet the blacks from their mountain fastnesses were destroying them in detail. Finding it impossible to conquer the island in this way, Leclerc sought to win over the negro generals, and succeeded with Christophe and those under him, including Dessalines. He next made his propositions to Toussaint, offering as conditions of peace to respect the liberty of the people, and confirming this by the most solemn oaths to leave the government of the island in Toussaint's hands, and to employ the officers of his army according to their rank, while for himself he would only hold the office of delegate from France by Toussaint's side. Toussaint accepted his offers, and a treaty of peace was concluded May 1. He avowed however his own determination to leave public life, and retired to his estate near Ennery. But Leclerc had determined upon his destruction. At his direction Gen. Brunet on June 7 sent him an apparently cordial letter, asking for an interview of an hour in relation to some arrangements for providing for the black troops, inviting him to bring his wife with him, and closing with assuring him of the sincerity of his friendship. Toussaint went to Gonaïves, and after a short conversation Brunet left the room, when an armed force entered and seized Toussaint, and at midnight put him on board a French frigate, with his family. On their arrival at Brest he was separated from his family, whom he was never allowed to see again. On Aug. 17 he reached Paris under guard, and was at once confined in the Temple, whence he was transferred, without trial and without any explanation of the cause of his arrest, to the dungeons of the castle of Joux, in the department of Doubs. Here, deprived of all society, subjected to the intense cold with insufficient clothing, and with too little food to sustain life, he appealed repeatedly but in vain for a trial; and as well as his failing strength would allow, he began his defence, which was transmitted to Bonaparte, but elicited no reply. Finally the governor of the castle went away for four days and left Toussaint without food or drink. On his return he was dead, and the rats had gnawed his feet. An autopsy was

held, and his death was said to have been caused by apoplexy.—Lives of Toussaint have been written, among others, by Saint-Rémy (Paris, 1850), the Rev. John R. Beard, D. D. (London, 1853), Hannah Lee (Boston, 1854), C. W. Elliott (New York, 1855), and J. Redpath (Boston, 1863).

**TOWHEE.** See CHEWINK.

**TOWN** (Ang. Sax. *tun*, from *tynan*, to enclose), originally an enclosure of the farm and farm house by a hedge, and finally of a collection of houses. Towns began to exist as municipalities in Germany in the time of the emperor Henry the Fowler (919-936), who caused all the important villages to be surrounded with walls or earthworks and ditches, as a defence against the Huns. Certain of the landless freemen were compelled to reside in these towns, while others were attracted by the privileges he conferred. These were in the nature of charters or contracts with the inhabitants, and had reference to various subjects. The germ of the town thus planted grew vigorously. The princes and bishops of the empire created towns on their own fiefs and benefices, and granted charters. For several hundred years thereafter municipal charters were granted in Europe at the political, military, or financial convenience of the ruling powers. In Spain the Christian kings created towns and granted municipal charters on the frontier, as the territory was slowly reconquered from the Moors. In England charters were granted liberally by King John, to enlist the common people on his side in his contests with the barons; and in France by Louis the Fat for similar reasons. Sometimes municipalities were chartered as a means of increasing or more conveniently collecting the king's revenue. In Holland the municipal system embraced nearly all the territory and population. In Germany leagues of the free towns were formed, either for common defence or for commercial purposes. Of the former, the Swabian league and the league of the Rhine were the most important; while of the latter, the league of the Hanse towns, or the Hanseatic league, was the most remarkable and most powerful confederation of municipalities that ever existed. (See HANSEATIC LEAGUE.) From various causes the self-governing feature of the towns of continental Europe has been almost entirely obliterated.—The system of town government has existed in New England since the settlement of the colonies, and in substantially the same form as at present, except that classes of town officers have been largely increased in number, and their various duties more particularly prescribed. Here it still prevails in its purest form; in New York and a few other states it exists in a modified form; with two or three exceptions, it is not found in the southern states. In New England it is the most important political division of the state. Excepting unorganized portions of Maine, New Hampshire, and Vermont, and certain incor-

porated cities which have superseded towns, the entire territory and population are under town government. In 1870 there were in New England 1,424 towns, with an average area of 34 sq. m., and an average population of 2,450, or, excluding cities and towns having over 10,000 inhabitants, 1,700. The town is a political and corporate body created by the legislature. Its rights, duties, and liabilities are defined by law, and it is responsible for any act or omission in violation of the law to the person injured or to the state. It can be fined in the same manner as an individual. Except in Massachusetts and Maine, where representation is by districts, it is entitled to an independent representation in the lower branch of the legislature. It elects its own executive officers, supports schools, maintains roads and bridges, supports paupers, restrains lunatics, manages a local police, protects the public health against infectious diseases, collects through its own officers not only its self-imposed taxes for local purposes, but also the state taxes and those levied by county officers, and generally administers its own public affairs. The town officers are usually elected annually and in the spring. The chief ones are a town clerk, three, five, seven, or nine selectmen, three or more assessors with sometimes assistant assessors, three or more overseers of the poor, a treasurer, one or more surveyors of highways, three or more members of school committee, and constables, who are required to collect taxes unless collectors are chosen. The most important officers are the selectmen, who transact the general public business of the town. Usually one of them, called the first selectman, appointed by the body from their own number or elected to that position by the freemen of the town, acts as the agent and general executive officer, but in the more important matters he consults the other selectmen. The most important business, such as that relating to taxes, and establishing roads, bridges, &c., is transacted by the voters of the town in town meeting, which is the general legislative body of the town. The county in New England is an unimportant subdivision of the state, and exists mainly for judicial purposes. Even the state does comparatively little public business, and the towns raise by taxation and expend at least eight times the amount of money that the state requires for its purposes.—In marked contrast to the town system as it exists in New England is the county system, which prevails in California, Delaware, Nebraska, Nevada, and Oregon, and in all the southern states excepting North Carolina, Virginia, and West Virginia. In these states the county is the important political subdivision of the state, while the town or township, where it exists, is little more than a nominal territorial division, without political power. The county is created by the legislature, and is responsible to the state for its share of the state taxation. Excluding

the unorganized parts of the state, the average area of the counties in these states in 1870 was 1,040 sq. m., and their average population 11,236; or excluding also the partly organized and settled states of the Pacific slope, their average area was 784 sq. m., and their average population 11,515, or about 15 inhabitants to the square mile. The affairs of the county are administered by its own officers chosen by the people of the county or appointed by other county officers. These are usually the court of county commissioners, assessor, treasurer, collector, superintendent of education, apporportioners of roads, and superintendents of roads, besides certain judicial officers.—In the middle, western, and northwestern states, excepting those above mentioned, and in North Carolina, Virginia, and West Virginia, a union of the town and county systems, which has been called the "compromise system," prevails. In these states the political power, which in New England is vested in the town and in the southern states in the county, is divided between the two. The county is the political unit; it is a body politic with the usual corporate powers; but it is subdivided into towns or townships, which possess considerable political rights. Besides the county officers, there are town officers usually elected annually by the people of the town. They are clothed with minor political powers, but their action in more important matters is subject to revision by the higher county officers. In New York the powers of the county are exercised by a board of supervisors in which the towns of the county are represented as equal political communities. The supervisor who represents the town in the county board has other town duties, and is thus both an officer of the town and of the county. This is also the case in Illinois, Michigan, New Jersey, Virginia, West Virginia, and Wisconsin. In Indiana, Iowa, Kansas, Minnesota, North Carolina, Ohio, and Pennsylvania, the affairs of the county are usually managed by a board of three commissioners, who are elected from the body of the county and have no town duties whatever. In New York and the more eastern of the states where the mixed system prevails, the town in political importance approaches more nearly to that of New England; but in some parts of the west the township (this word being there more common than town) is a mere geographical division embracing 36 sq. m., and has very limited political functions. Town is often used popularly in the west to denote a small municipality, as a village. In none of the states outside of New England do the towns, or townships, as such, send representatives to the legislature.—Other forms of municipalities have been created by the different states. Boroughs and villages are corporations with peculiar powers and privileges, such as have reference to special objects and are not granted to towns by general laws. In England there are municipal and parliamentary

boroughs, the former being a town (some, as Liverpool, of the largest size) having a municipal government, and the latter a town or district (sometimes including several municipal boroughs) that sends a member or members to parliament; while in the United States a borough is a municipal corporation that is usually expected to become a city at some future time, having powers less extensive than those of a city and different from those of a town. In the extent and variety of its powers the city is the most important municipality. In England a city is any town that either is or has been the see of a bishop and has a cathedral; but in the United States the distinction between a town and a city usually refers to size and always to the form of municipal government. The governing power of cities is usually vested in a mayor and council, composed of one or two boards; but the details of the government vary greatly. Probably no two cities can be found whose charters or governments are precisely alike.—See Elliott's "New England History" (Boston, 1857); Haines's "Township Organization" (Chicago, 1865); "The Origin, Organization, and Influence of the Towns of New England," by Joel Parker (Cambridge, 1867); and the article on "The Minor Political Divisions of the United States," by S. A. Galpin, in the "Statistical Atlas of the United States" (1874). Town manuals have also been published in New York and most of the New England states.

**TOWNLEY, Charles**, an English collector of works of ancient art, born in Lancashire, Oct. 1, 1787, died in Westminster, Jan. 8, 1805. He received his education on the continent, and during a residence in Rome between 1765 and 1772 he devoted his fortune largely to the purchase of ancient marbles, terra cottas, bronzes, gems, &c., aided by the advice and experience of Winckelmann and others. After his return to England, he added to his collection by means of agents at Rome, and by purchasing that of Nollekens. After his death his collection of marbles was purchased by the nation for £20,000, and in 1814 his bronzes, coins, and gems became the public property at a cost of £8,200. All are now incorporated with the general collection of Græco-Roman remains in the British museum.

**TOWNS, a N. E. county of Georgia**, bordering on North Carolina, and drained by the head streams of the Hiawassee river; area, about 250 sq. m.; pop. in 1870, 2,780, of whom 155 were colored. The surface is hilly and mountainous, and the soil generally fertile. The chief productions in 1870 were 5,090 bushels of wheat, 5,389 of rye, 61,990 of Indian corn, and 8,927 of oats. There were 458 horses, 1,975 cattle, 2,575 sheep, and 4,183 swine. Capital, Hiawassee.

**TOWNSHEND, L. Charles**, second viscount, an English statesman, born in 1676, died at Rainham, Norfolk, June 21, 1788. He succeeded to his title at ten years of age, and soon after

taking his seat in the house of peers attached himself to the whigs. In 1706 he was appointed one of the commissioners to treat for the union with Scotland, and in 1707 captain of the yeomen of the queen's guard; and in 1709, in the capacity of ambassador extraordinary to the United Provinces, he negotiated the barrier treaty. The accession of George I. having brought the whigs into power, Townshend was appointed one of the principal secretaries of state, and took the lead in the administration until the summer of 1716, when, owing to the intrigues of his colleagues, Lord Sunderland and Gen. Stanhope, he was dismissed. To break the ignominy of his fall, he was offered the lord-lieutenancy of Ireland, which he indignantly declined; but the king, fearing the public displeasure, induced him to accept it. The growing influence of Sunderland and Stanhope with the king rendered the position uncomfortable, and, with his colleague and brother-in-law Walpole, he retired from office in April, 1717. After remaining several years in opposition, he was in 1720 appointed president of the council, and on the reconstruction of the ministry in 1721 he resumed his old position of secretary of state, Walpole becoming first lord of the treasury and chancellor of the exchequer. Finally, displeased with Walpole's growing ascendancy and disputing upon questions of public policy, Townshend resigned, May 15, 1730. **II. Charles**, an English statesman, grandson of the preceding, born Aug. 28, 1725, died Sept. 4, 1767. He entered parliament in 1747, and in 1753 brought himself into notice by a speech of great power and eloquence on the marriage bill. In 1754 he was appointed a lord of the admiralty, and in the first administration of Pitt he was treasurer of the chamber, which office in 1761 he exchanged for that of secretary of war. During the ministry of the earl of Bute he remained out of office, but in that of George Grenville which succeeded (1763), he was appointed first lord of trade and the plantations. He zealously supported Grenville's stamp act, introduced in 1765, in a speech which elicited from Col. Barré in reply one of the most memorable efforts of parliamentary eloquence; but during the Rockingham administration, in which he held the office of paymaster of the forces, he advocated the repeal of the act. On the formation of the second Pitt administration in 1766, he became chancellor of the exchequer, and, with a vacillation which gained him the name of the weathercock, advocated the necessity of a tax upon American ports. On June 2, 1767, he introduced into the house of commons the celebrated resolutions imposing duties upon paper, tea, and other articles imported into the American colonies, which eventually led to their revolt and independence. The illness of Pitt rendered necessary a reconstruction of the cabinet, and Townshend was generally understood to have been selected to form a new ministry, when he suddenly died.

**TOWNSHIP.** See **TOWN**, and **SURVEYING**.

**TOXICODENDRON.** See **SUMACH**.

**TOXICOLOGY.** See **POISON**.

**TOXODON** (Gr. τόξον, a bow, and ὀδόν, a tooth), a name applied by Owen to a genus of extinct mammals of the order of ungulates, with affinities to edentates and rodents. The first species, named by Owen the *T. Platensis*, was found in a miocene clay in South America, about 120 m. N. W. of Montevideo; it was established on a cranium 2½ ft. long, elongated, with a flattened occiput, small cerebral cavity, remarkably strong and widely expanded zygomatic arches, and transverse glenoid cavity; the upper molars were seven on each side, implanted with the convexity outward, the opposite of what occurs in rodents; they were long, arched, without roots, the enamel forming an irregular prismatic grooved tube; upper incisors four, the external the largest, like those of rodents in structure, and worn away in the same chisel shape; in the lower jaw were seven molars on a side, and six incisors ranged in a semicircle; the name was derived from the curve of the outer upper incisors. It was large, low on the legs, with the aspect and habits of a pachyderm. It shows an affinity to the *sternia* (like the manatee) in the flattened occiput, small brain cavity, and nasal passages widely opened above, but differs in the size of the frontal sinuses and in the incisors; it seems to have formed a connecting link between the rodents and the ungulates. It was probably aquatic to a certain extent.—See "Fossil Mammals of the Voyage of the Beagle," described and figured by Prof. Owen (4to, London, 1840).

**TRACHEOTOMY** (Gr. τραχεια, the windpipe, and τέμνω, to cut), a surgical operation by which the trachea or windpipe is opened. Tracheotomy may be performed with propriety in cases where admission of air into the lungs is obstructed either by disease or by a foreign body; and it has sometimes been tried with success to facilitate the inflation of the lungs in cases of suspended animation. The operation is not free from danger, and in the first class of cases, though giving marked temporary relief, it does nothing toward curing the disease itself. It consists in first making an incision in the median line of the throat, either below or above the thyroid gland, and dissecting down to the trachea, cautiously pushing aside the sterno-hyoid muscles and vessels lying in the vicinity, till the trachea is exposed. When the bleeding has ceased, the trachea is opened by a vertical incision, and a portion of one or more of its rings removed; through the opening thus made a silver canula is introduced, which when obstructed by mucus may be removed, cleansed, and again inserted. If the obstruction to respiration is removed, the canula may be withdrawn and the orifice allowed to heal; but if not, the canula must continue to be worn. If the operation is performed to aid in restoring animation or to remove a foreign body, no canula need be inserted, and

the wound should be closed so soon as the object is effected.

**TRACHYTE** (Gr. *τραχύς*, rough), a rock of volcanic origin, named from the roughness of its surface. It consists chiefly of glassy feldspar, sometimes associated with hornblende, and also with augite. When these minerals predominate, the rock passes into the varieties of trap called basalt, greenstone, dolerite, &c.

**TRACT AND PUBLICATION SOCIETIES.** The printing of short religious treatises and narratives for cheap or gratuitous distribution was very early practised. Indeed, prior to the introduction of printing, Wycliffe circulated his views by means of brief essays, which were transcribed and passed from hand to hand. Strype testifies to the circulation of some of Tyndale's tracts about 1530. In the 17th century there were associations for printing and promoting the sale of religious works. In 1701 the "Society for Promoting Christian Knowledge," consisting of members of the church of England, was founded to promote charity schools in all parts of England and Wales, and to disperse both at home and abroad Bibles and tracts of religion. In 1742 John Wesley began the publication and distribution of tracts and books on a large scale, and in 1782 he and Dr. Coke organized the "Society for the Distribution of Tracts among the Poor." In 1750 the "Society for Promoting Religious Knowledge among the Poor" was organized in London, and was the first publishing society in which members of different religious denominations were united. In 1756 societies were established at Edinburgh and Glasgow for similar objects, and for several years circulated many religious publications; but eventually they as well as the London society declined. In 1795 Miss Hannah More commenced at Bath a monthly series of short religious tales which she named "Cheap Repository," of which 2,000,000 copies were sold the first year. In it was published the widely popular story of "The Shepherd of Salisbury Plain." Mrs. Rebecca Wilkinson, of Olapham, Surrey, also wrote and published many small books and tracts. The "Philanthropic Society" printed for her in the course of a few years, commencing with 1792, 440,250 copies of books and tracts.—In 1793 the "Religious Tract Society," or as it is now called the "Religious Tract and Book Society of Scotland," was founded in Edinburgh by the Rev. John Campbell, a missionary to Africa. In 1855 this society adopted the colportage system of the American tract society, to which it has since given a large part of its effort. In that year it sent out three colporteurs; in 1875 it sent out 234 in Scotland and 20 in the north of England. In the year ending March 31, 1875, its circulation was 2,855,000, including 55,000 copies of the Scriptures and 120,000 other bound volumes, besides 300,000 hymn books, 1,240,000 periodicals, and 1,140,000 tracts.—The "Religious Tract Society" of

London was founded in May, 1799. It had its origin in the labors of the Rev. George Burder of Coventry, who had begun printing tracts on his own account in 1781, of a more directly religious character than those of Miss More. He continued their occasional issue in connection with some friends for several years, and then convened a meeting of ministers by whom the society was established under its present name. Among them were the Rev. Messrs. Rowland Hill, William Newman, Matthew Wilks, and Joseph Hughes, for many years its secretary. Its entire receipts the first year were £467 7s. 4d., of which £203 10s. 8d. were from contributions, &c., and £263 16s. 8d. from sales. In 1849, when the society celebrated its jubilee, they had risen to £50,981 15s. 8d., of which £4,939 2s. 8d. were from contributions, &c., and £44,603 16s. 6d. from sales. The total receipts of 50 years from contributions and legacies, up to 1849, were £152,552 3s., from sales £1,023,215 13s. 1d., making with other items £1,202,242 13s. 8d. By the expenditure of this sum the society had published 5,148 different works in 110 languages and dialects, of which it had issued over 500,000,000 copies. It now keeps on its catalogue about 10,000 different publications. It issued during the year ending March 31, 1875, 303 new volumes and 167 new tracts. The total circulation from the home depositories during the year was 46,536,057, including about 23,000,000 tracts. The issues in foreign depositories in Europe, India, China, Africa, and elsewhere were about 10,000,000 more. The entire number of issues since the formation of the society was about 1,595,000,000, of 18,023 different publications in 120 different languages and dialects. Its grants of books, tracts, &c., for the year amounted to £28,328 7s. 7d. This society owns no presses or bindery. It maintains three depositories in London, one at Brighton, one at Manchester, and others in the principal cities of continental Europe, in Constantinople, Beyrout, and different cities of India, China, and Japan; and there are auxiliary and coöperating societies in Great Britain, Canada, and Australia. During the year it made grants of books and tracts to the colporteurs in the north of England from the religious tract and book society of Scotland, and a grant amounting to £400 to the negroes of the southern United States. There are several other societies in Great Britain for the circulation and distribution of religious books and tracts, each of the principal religious denominations having one or more.—The most important of the tract societies of continental Europe is the Hamburg tract society, organized in 1836, which issued from April 1, 1872, to Nov. 1, 1874, 2,648,000 copies of its publications in German, Danish, and Lettish; and it has issued since its organization 27,000,000 tracts in seven languages. The Paris tract society has issued 665,380 publications. The Toulouse book society has issued 137,129 vol-

umes. The evangelical society of Geneva, organized in 1831, expended in 1874 \$15,000, and has issued in all 335,000 volumes and 3,000,000 tracts. The Belgian evangelical society issued 1,380 volumes and 202,000 tracts in 1874. The British American book and tract society was organized at Halifax in 1867, and has given its effort largely to colportage. In 1874 it employed 26 colporteurs at an expense of \$34,629. Its total expenditure has been \$169,193.—The first religious publication society in the United States was the "Methodist Book Concern," originally established in Philadelphia, which issued its first publication in 1789. It was removed to New York in 1804, and for 29 years had its depository in Crosby street. In 1822 the agents established a bindery, and in 1824 added a printing office. In 1833 it was removed to No. 200 Mulberry street, and in February, 1836, its premises were destroyed by fire, and a loss of \$250,000 incurred. A new building was immediately erected on the same site, which is still occupied by the printing office and bindery. In 1869 a building for a sales house and offices was purchased in Broadway at the corner of 11th street. The book concern has a depository in Cincinnati, which publishes periodicals and a few books; it has also depositories publishing denominational journals, and keeping full supplies of its books, at Boston, Pittsburgh, Chicago, St. Louis, and San Francisco; and the ministers of the denomination are agents for the sale and circulation of its journals and tracts. Its publications consist of books, periodicals, and tracts. The book concern is conducted strictly as a business house, and makes no donations. In 1874 the Methodist Episcopal tract society made donations of tracts, purchased from the book concern, to the value of \$15,000, besides contributing more than \$5,000 for the publications of missionary presses in foreign lands. In 1844 the division of the Methodist church led to the organization of a book concern connected with the Methodist church, South, at Nashville, Tenn., which eventually received \$200,000 of the capital of the book concern as the share of the church south.—The Rev. Dr. John Stanford published tracts in New York in 1786. In 1803 the Massachusetts "Society for Promoting Christian Knowledge" was formed by the Rev. Drs. Tappan, Holmes, and Morse, Lieutenant Governor Philips, and others. This seems to have been the earliest undenominational tract society organized in America. Subsequently numerous local societies sprung into existence, of which the "Religious Tract Society" of New York, founded in 1812, and the "New England Tract Society" at Andover, in 1814, seem to have been the most efficient. The latter grew rapidly, and in 1823 changed its name to the "American Tract Society," and shortly thereafter its location to Boston, greatly enlarging its operations. In 1825 this society had 205 auxiliaries, had issued 177 gen-

eral tracts and 19 of a series for the young, had published in all over 800,000 copies, and had commenced the publication of an almanac and a monthly journal. In the spring of 1825 the "American Tract Society" was organized in New York, and was intended to unite the local societies then in existence as far as possible as auxiliaries. The Boston society became a branch of it. This union continued till May, 1859, when, in consequence of the dissatisfaction of a considerable number of the members in New England and elsewhere at the hesitation of the American tract society in New York to publish tracts or treatises on the subject of slavery, the two societies resumed their independent organizations. In 1870 the total sales of the society at Boston amounted to \$103,027 88, and the expenses of the charitable department to \$7,970 95. In 1871 it simplified its plan of operation by contracting with a publishing house to print, bind, and sell its tracts, periodicals, and books. This arrangement proved efficient and economical, and enabled the society, while carrying forward its usual work, to clear off, before May, 1875, a debt of \$22,498 27 incurred previous to 1871. This plan is still pursued. The American tract society in New York, owning a large building in Nassau and Spruce streets called the "Tract House," manufactures its publications, and has become one of the largest of the national benevolent societies of the country. At first only English tracts were printed, 215 the first year; the third year one volume, and tracts in Spanish, French, and German. Every succeeding year the list was enlarged, until at the end of 50 years (1875) its catalogue contained 1,133 volumes and 8,497 smaller publications. In 1843 was commenced the "American Messenger," a monthly family paper; in 1847 the *Botschafter*, a German paper; in 1852 the "Child's Paper," an illustrated juvenile; in 1871 the "Morning Light," an illustrated monthly for beginners, the "Illustrated Christian Weekly," and the *Volksfreund*, a similar weekly in German. The average daily issue from the tract house is 54,000 copies of publications, of which 4,000 are volumes; and the entire issue from the beginning has been 358,718,338 copies, of 8,338,141,531 pages, of which 831,683,312 copies were tracts averaging about 8 pages each, and 27,035,026 volumes, averaging about 208 pages; 86,307,806 tracts and 2,603,884 volumes were in foreign languages. The society has also expended in printing at mission stations in foreign lands \$616,687 80. The entire receipts from April, 1825, to April, 1875, were \$13,597,589 63, of which \$8,957,219 50 were from sales, \$312,274 69 from rents, and \$4,328,095 44 from donations and legacies. In 1842 the society commenced its colportage system, which it has maintained up to the present time. The *colporteur*, as the term is employed by the society, is an itinerant missionary, who distributes its publica-

tions either by sale, partial sale, or gift, as may seem best in each case, from the desire to do good, and also engages as opportunity offers in the more direct missionary labors of preaching, prayer, and religious conversation; his expenses are partly defrayed by the society, and partly by the sales of books. Through

this agency, for the 34 years from its establishment in 1842 to 1875, 10,503,696 volumes were sold and 2,780,066 given away.—The different religious denominations have each also their tract or publication societies, of which the most important particulars are given in the following table:

ORGANIZATIONS.	Date of Organization.	No. of publications on catalogue.	ISSUED DURING THE YEAR 1874-'5.		Value of issue during 1874-'5.
			Volumes.	Tracts, pamphlets, and periodicals.	
Methodist Episcopal book concern.....	1789	2,509	852,170	85,055,428	\$1,560,618 74

**TRACTARIANISM**, a movement within the church of England, so called from a series of papers entitled “Tracts for the Times,” published at Oxford from 1833 to 1841. It may be traced to the agitation of Roman Catholic emancipation in parliament, and particularly to the suppression of the sees of the Irish bishops who voted against the reform bill in the house of lords in 1831. An address deprecating change, and urging a revival of the ancient discipline, was presented to the archbishop of Canterbury, signed by 7,000 clergymen; in the following May the king alluded to the movement in his birthday speech; and meetings were held throughout the country in behalf of the maintenance of the church. The sentiments now advocated had been already expressed by the Rev. John Keble in his “Christian Year” (1827), and by the Rev. Hugh James Rose in the “British Magazine.” In July, 1833, a conference was held at Hadleigh, which led to the publication of the “Tracts for the Times.” These were 90 in number, and consisted of extracts from the writings of the ante-Nicene fathers and some later ecclesiastical authorities, and original works by E. B. Pusey, John Keble, Isaac Williams, John Henry Newman, and others. They advocated the doctrines of apostolical succession, baptismal regeneration, the real presence, priestly absolution, the authority of the church, and the value of tradition. The movement culminated in the publication of tract No. 90, which maintained the compatibility of the thirty-nine articles with the doctrines of the Roman Catholic church. This was condemned by the hebdomadal board of Oxford university in 1841, and its author, Dr. Newman, in 1843 resigned his vicarage of St. Mary’s, Oxford, and in 1845 entered the Roman Catholic church. In 1843 Dr. Pusey was suspended from the office of university preacher on account of a sermon on the eucharist. The tractarian movement has resulted in the development of high church and ritualistic views,

the restoration and building of numerous churches, and the secession of many members of the church of England, including some clergymen of distinction, to the Roman Catholic church.—See Perceval, “Collection of Papers” (1842); W. Palmer, “Narrative of Events” (1843); and F. Oakeley, “Historical Notes on the Tractarian Movement” (1865).

**TRACTORS, Metalle.** See PERKINS, ELISHA.

**TRACY.** See DESTUTT DE TRACY.

**TRADE MARK**, the name, symbol, form, or device used by a manufacturer or merchant to distinguish the merchandise which he produces or sells from that of others, in order that such merchandise may be known as his, and that he may secure the profits arising from its reputation for superiority. Trade marks have long been protected by law, on the general principles of equity, in nearly all civilized countries; but statutes for this purpose are of recent origin. The object of such laws is not only to secure to the individual the fruits of his skill, industry, and enterprise, but also to protect the public against frauds. In the United States trade marks are protected by the statute of 1870, which is the first one passed by congress for this purpose. It does not interfere with the common law protection, which is open to every person independently of the statute. It provides that any person or firm domiciled in the United States, or any corporation created by the law of the United States or of any state, may, by complying with the requirements of the act, obtain protection for any lawful trade mark to which he or it is entitled, for the term of 30 years, with the privilege of a renewed term for the same period. Every applicant must record in the patent office his name, residence, and place of business; the class of merchandise, and the particular description of goods comprised in such class, to which the trade mark has been or is intended to be applied; a description of the mark, with facsimiles thereof and its mode of use; and the length of time, if any, during which it has been used.

He must also pay a fee of \$25, and file a sworn declaration that he is entitled to the exclusive use of the mark, and that the description and facsimiles presented are true representations. If, on examination in the patent office, such symbol is found to have the requisites of a valid trade mark, it is registered, and the owner becomes entitled to legal and equitable remedies against its violation.—Property in a trade mark is acquired by the original application to some species of merchandise of a device or symbol not in actual use to designate articles of the same kind or class. If such symbol have the essential qualities of a lawful trade mark, the owner becomes entitled to its exclusive use within the limits prescribed by law. But whoever first adopts a mark acquires a right to its exclusive use only in connection with the particular class of merchandise to which he has applied it. His right to use it as a mark on iron does not prevent its lawful use by another on cloth. The mark must also be put into actual use before it may be claimed exclusively by any person; protection begins from the time of such use, without regard to whether the mark has gained a reputation. No person will be protected in the use of a trade mark which is not truthful, and is used with the design of deceiving the public, or which is employed in any unlawful business, or upon any injurious article.—One of the most important requisites of a valid trade mark is that it shall, either by itself or by association, point distinctively to the origin or ownership of the article to which it is applied. By its individuality, it must associate the merchandise with the producer or the place of production, so that the purchaser may know that all articles bearing the same mark are genuine and of the same quality and from the same source. The mark thus becomes equivalent to the owner's commercial signature.—No person has a right to the exclusive use of a mark which is of such a character that others may employ it with equal truth. A generic name of an article, or one merely descriptive, or representing the kind, quality, ingredients, or characteristics of the article, may not be used as a valid trade mark. "Parchment deed," "beeswax oil," "superior white wheat," "desiccated codfish," are not valid as trade marks, because they are the proper descriptive appellations of the articles. Geographical names used in their proper sense cannot become lawful trade marks. All coal mined in the Lackawanna valley, or all wheat grown in California, may be sold as "Lackawanna coal" or "California wheat," by whomsoever produced. But if the phrase is used as an arbitrary symbol, and is not intended to represent that the merchandise is produced in the region bearing the name, and is so understood by the public, it may be monopolized as a mark for any class of goods. "Damascus blade," applied to scythes made in the United States, is a valid trade mark.—It is not clearly settled how far a person's own name

will constitute a valid trade mark independently of the statute. In general all persons of the same name have an equal right to any honest use of such name. But if one person has acquired a valuable reputation for his own name in connection with a particular kind of merchandise, a court of equity might restrain another person of the same name from using it as a trade mark for the same class of goods, if his intent were clearly to deceive the public and to injure the person who had first so employed it. The statute of 1870 prohibits the registration of any proposed trade mark "which is merely the name of a person, firm, or corporation only, unless accompanied by a mark sufficient to distinguish it from the same name when used by other persons;" except that any lawful trade mark in use when the act was passed may be registered. Names of persons, living or dead, other than the owner of the trade mark, may be monopolized as arbitrary. Symbols for any class of goods, as "Bismarck collar," pseudonyms or imaginary names, &c., will also be protected. Mere initials or numerals do not generally constitute valid trade marks, but may become so in special cases. The title of a book, newspaper, magazine, or other publication may have the essential characteristics of a trade mark; but in such cases protection has usually been granted on the ground of fraud committed by the person who has unlawfully appropriated such title, or one closely resembling it.—Property in a trade mark is invaded when a person falsely uses such mark or a colorable imitation of it, with the intention or effect of falsely representing his own goods as those of another. The usual remedy of the injured person is by an injunction restraining the wrong doer from a further use of the name, or by an action at law for damages. Generally an injunction will be granted by a court of equity only when the petitioner's legal title is clear. If the lawful owner have suffered damages, he may proceed in equity for the profits made by the wrong doer, or he may sue at law for the loss he has sustained. The good will of a trade is a species of property analogous to that in trade marks.—The statute of 1870 provides for extending protection to the trade marks of aliens resident in any foreign country which by treaty or convention affords similar privileges to citizens of the United States. Treaties and conventions for this purpose have been concluded with France, Belgium, Germany, the Austro-Hungarian empire, and Russia. The principal countries of Europe have passed laws for the protection of trade marks, and in some it is obligatory upon manufacturers to affix marks to their products.

**TRADES UNION**, an association of workmen for concerted action upon questions of wages, hours of labor, and other conditions of employment, and for mutual relief. Apart from the mediæval craft guilds, which included employers (see GUILD), combinations of workmen to ob-

tain increased wages have occasionally appeared for several centuries; but until a comparatively recent date they were everywhere the object of severe legal penalties. Toward the close of the last century the formation of workmen's societies received a new impulse from the introduction of machinery, which, by concentrating the leading industries in large establishments, gradually reduced many small masters to the position of laborers, and vastly increased the difficulty of rising from the working to the employing class. In England unions had been formed among the wool combers, cotton spinners, weavers, calico printers, scissors grinders, and men of other trades, before the beginning of this century. New laws

prohibiting such combinations were enacted in 1799 and 1800, but were evaded in various ways; and in 1824 a committee of the house of commons reported that these laws had only produced irritation, distrust, and violence. They were repealed, and an act was passed to protect combinations of workmen or employers from prosecution for conspiracy under the common law. Later acts were still more favorable to the unions, providing for their registration and enabling them to hold real estate. At the beginning of 1876 the number of members enrolled in the trades unions of the United Kingdom was estimated at 1,200,000, of which number more than one fourth is comprised in the 14 societies named in the following table:

NAMES OF SOCIETIES.	Date of organization.	Year of report.	No. of branches.	No. of members.	Year's income.	Year's expenditures.	Funds in hand.
Amalgamated society of engineers.....	1851	1874	379*	48,150	£118,556	£50,490	£238,990
Friendly society of operative stone masons.....	1383	.....	360	26,000	25,989	.....	.....
United operative masons of Scotland.....	1853	1874	98	10,632	9,577	8,350	9,289
Friendly society of iron founders of England, Ireland, and Wales.....	1809	1874	106	12,097	84,467	29,346	55,348
Boiler makers and iron ship builders of Great Britain and Ireland.....	1834	1873-'4	143	14,715	83,945	.....	49,308
Amalgamated society of carpenters and joiners.....	1860	1874	265†	18,517	84,454	28,670	41,264
Amalgamated society of tailors.....	1866	1873-'4	361	18,298	18,848	8,506	7,094
Amalgamated society of railway servants.....	1871	.....	173	14,500	.....	.....	9,300
Amalgamated association of iron and steel workers.....	.....	1874	269	21,962	.....	21,382	15,000
Durham miners' association.....	1869	.....	217	40,000	44,618	38,884	.....
West Yorkshire miners' association.....	1871	1874	80	13,500	48,806	31,174	18,415
Northumberland miners' mutual confident association.....	.....	1873	.....	17,000	.....	.....	19,000
National agricultural laborers' union.....	1871	1874-'5	1,368	55,652	41,244	33,125	4,000
Amalgamated association of operative cotton spinners.....	1870	1873-'4	.....	12,312	.....	.....	30,000

The following societies comprised in 1875 a membership of 258,550:

Miners' national union.....	146,000
South Yorkshire miners' association.....	25,000
East Lancashire power-loom weavers.....	16,000
Federal union of agricultural laborers.....	30,000
Kent and Sussex agricultural laborers' union.....	10,000
General union of carpenters and joiners.....	9,700
Operative bricklayers' accident and burial society...	7,350
United Kingdom society of coach builders.....	7,300
North Wales quarrymen's union.....	7,200

The 23 societies named above comprise all having not less than 7,000 members which were represented in the national trades union congress at Liverpool in January, 1875, or in that held in Glasgow in October of the same year, besides a few that were not represented in either. Their aggregate membership is 570,700, or nearly half of the total estimated membership of the trades unions of the kingdom.—Trade societies comprise those organized for trade purposes alone, such as mutual support in strikes, and those which are also mutual benefit associations, the latter class now comprising nearly all of the stronger organizations, in which the expenditures for benefits are usually much greater than those incurred for strikes. But on the other hand, the amalgamated association of miners paid £80,000 within one year (1874-'5) to assist branches on strike in South Staffordshire. By the periodical

publication of reports showing the state of trade in various towns and districts, some of the unions render valuable service; and another useful device is that of keeping in each of the larger towns a "vacant book," in which the names of men out of employment and employers in want of men are registered. The qualifications for membership generally include good health, sound physique, ability as a workman, steady habits, and good moral character; and (except in societies of unskilled laborers) the candidate must have served a regular apprenticeship to his trade. The minimum limit of age for admission to full membership is usually 21 years; the maximum varies from 35 to 50 years. A prime object of these organizations is to obtain better wages, shorter time, or more agreeable conditions of employment. They discountenance long engagements at a preestablished rate of wages, oppose the practice of working beyond the customary hours, object to working in the same establishment with non-unionists, and usually seek to establish in each town or district a minimum rate of wages. In the skilled trades they insist upon apprenticeship, and seek to regulate the proportion between apprentices and workmen, defending their action on the ground that it is the workman, and not the employer, who instructs the apprentice. In the various trades connected with building and engineering the members of the unions generally refuse to work under piece masters or sub-contractors. The objection to piece work is, that it is desired by

\* Of these, 7 were in Australia, 3 in New Zealand, 6 in Canada, 81 in the United States, and 6 in other countries.

† Of these, 14, comprising 447 members, were in the United States, and 4 were in Canada.

the employers only for the purpose of exciting among the men a spirit of rivalry, which in their opinion would result in a reduction of wages or an increase in the hours of labor. In the mining trade, when the output of coal has been in excess of the demand, they have sometimes insisted on diminishing production, in order that the price might not fall so low as to entail a reduction of wages. Some unions have endeavored to fix a limit to the amount of work which each man might do.—One of the best results of free association among the workmen of the United Kingdom is the mental culture which it has promoted. The members of trades unions generally believe that wages have been considerably raised through their agency, and they usually assume that this advantage to the workmen has been gained by cutting down the profits of the employers. Some employers deny that the unions have affected wages at all, while others complain that they have affected them to an injurious degree. Among political economists, some strenuously maintain that wages can only be determined by the law of supply and demand; others admit that combination may have raised the rate of wages in particular trades, but contend that it has thereby raised the price of the products of those trades in the same proportion, and thus increased the cost of living to all classes, including large masses of workmen, who, without receiving any increase in their own wages, are compelled as purchasers of commodities to contribute to the increase received by their more fortunate fellows. On the other hand, Mr. W. T. Thornton, in his well known work on labor published in 1869, argues that the efforts of the trades unions have raised the wages of laborers in general, and estimates the addition thus made to the aggregate earnings of the working men of the United Kingdom at £9,000,000 per annum.—A trades union congress, composed of delegates from different unions and local federations, has been held annually since 1869. Thus far these congresses have confined their attention to objects which had a direct relation to the interests of the working classes, such as providing for the proper ventilation of mines, and reducing the hours of labor for women and children. Toward the adoption of such measures they have materially contributed, and the passage of the labor laws of 1875 is mainly attributable to the exertions of their committee. A federation for defensive purposes, called the United Kingdom alliance of organized trades, has existed for several years, but does not embrace any of the larger unions. There is also a workman's international league (distinct from the revolutionary international workmen's association), having for its object concert of action between English and foreign workmen in certain trades wherein the keenness of international competition tends to depress wages.—A national federation of associated employers of labor was formed in August, 1873. The

scope of its operations was limited to parliamentary legislation, the collection and distribution of information upon industrial questions, and the endeavor to secure unity of action among employers. The masters in the principal trades have long had associations for the specific purpose of resisting those of the men. In case of a strike against one of their members, they assist him in obtaining other workmen, supply him with funds or credit, undertake or guarantee his contracts, and in other ways help him to dispense with his workmen until they accept his terms. A "lockout" is a retaliatory measure on the part of employers, to deprive workmen on strike of assistance from others by throwing the latter out of employment. The occurrence of strikes and lockouts has often been attended with riotous demonstrations and destruction of life and property. The principal strikes since the repeal of the combination laws were as follows:

TRADES.	Date.	No. of persons idle.	Duration of strike.
Manchester cotton spinners.....	1829	10,000	6 months.
Ashton and Staleybridge cotton spinners.....	1830	80,000	10 weeks.
Liverpool building trades.....	1838	.....	6 months.
Preston cotton spinners.....	1836	8,000	13 weeks.
Amalgamated engineers.....	1851	8,000	8 months.
Preston cotton spinners.....	1854	17,000	86 weeks.
London building trades.....	1859	7,556	.....
General lockout in the iron trade.	1855	200,000	16 weeks.
Clyde ship-building trade.....	1866	18,000	several months.
North of England iron trade.....	1866	12,000	5 months.
Colliers of South Wales.....	1871	10,000	12 weeks.

At the end of 1875 a strike occurred at the Erith iron works, which threatened to become general, the workmen resisting and the employers insisting upon piece work.—Members of the amalgamated society of engineers who were engaged in the unsuccessful strike of 1851 emigrated the same year to Australia, and established a branch at Sydney. Trades unions have since become general in Australia, and have enabled workmen not only to make their own terms with employers, but to exert a powerful influence upon legislation, especially in defeating appropriations to promote immigration of laborers. They have a trades and labor council comprising 23 societies and 3,000 members, with a permanent committee on parliamentary representation. In this colony eight hours as a rule constitute a working day, and wages vary from 1s. to 2s. (24 to 48 cts. gold) an hour. Trades unions also exist to some extent in New Zealand and other British colonies. There is an association known as the "Canada Labor Union," composed of delegates from the local trades unions, the object of which is to influence legislation in the interest of the working class. There are no trades unions in Canada of national (or rather of colonial) extent, except those which are connected with organizations in the United States.—Trades unions after the

English model (*Gewerksvereine*) began to appear in Germany in 1868. The laws prohibiting combination had been repealed in Prussia two years before, and a law passed permitting employers and workmen (excepting agricultural laborers) to arrange terms in their own way, provided they abstained from physical compulsion, insults, and defamation. A similar law was passed by the parliament of the North German confederation in 1869. The same year Dr. Max Hirsch formed a plan to unite the working classes of Germany into one confederation under a central direction. The local branches of all the trades within certain limits elect some central branch (if in a large town) or the branches of some central place, and commit to such branch or branches the election of a general council, which exercises the chief executive power, while the legislative power is committed to an assembly of branch delegates. These local or district federations are united in a national federation, with a legislative assembly composed of their several delegates, and a central executive committee elected by the assembly. There is also an officer known as the union attorney, who, besides being the chief business manager of the confederation, has the special task of disseminating its principles. Unlike the English trades unions, which sprang from small affiliations spontaneously formed by the working men, the system of the German *Gewerksvereine* originated with a member of the professional class, and existed in its completeness as an idea before the local unions had come into being. The number of members embraced in the German unions is therefore not as great as might be expected, in view of their elaborate organization. In 1869 it was stated at 30,000, comprised in 267 local societies existing in 145 towns, and representing the following trades: miners, masons and stone cutters, potters, carpenters, shipwrights, cabinet makers, shoe and harness makers, tailors, weavers, painters and lithographers, gold and silver smiths, machine builders, and metal workers. Besides these, the confederation included societies of factory operatives and other workpeople belonging to no special trade. By 1872 the number of trades had increased from 13 to 18, and the number of branches from 267 to 350; but the membership had fallen off to the extent of nearly 10,000, which was attributed in part to the war with France, and in part to the discouragement which followed the failure of the great strike of 1869 among the miners at Waldenburg in Silesia, which had been supported by the confederation. The increase of membership in 1873 and 1874 was about 2,000. There are large numbers of German trades unions devoted to the socialistic doctrines of Lassalle, who hold aloof from the confederation organized by Hirsch, and stigmatize its leaders as "harmony apostles." The growth of trades unions among the socialist workmen is greatly checked by the action of

the police, who break up large numbers of such societies every year, for interference in politics. —In France the legal position of the working class with respect to the right of combination is but indistinctly defined. In 1864 the law upon this subject was so modified as to make coalition no longer a crime, and to give to workmen the right of striking as well as that of holding public meetings. But the law of 1791, which prohibits societies composed of persons of the same trade or profession, was still in force. As the authorities had long tolerated associations formed in contravention of the law, the workmen now organized "societies of resistance," similar to those trades unions which are organized for trade purposes alone. Many of these were afterward affiliated with the international association. (See INTERNATIONAL ASSOCIATION.) In 1868 the government intimated that the various trades in Paris would be permitted to organize under the direction of syndical chambers, on condition of abstaining from politics. In 1875 there were about 100 such syndicates among the employers, and about 70 among the workmen. The latter were refused the privilege of forming a central committee, while the employers' syndicates have both a central committee and a newspaper organ.—In Belgium trades unions have become prominent within a few years past, and have made several vigorous strikes at the manufacturing centres. Switzerland has flourishing trades unions, which resemble the English societies, but several related trades are usually represented in one organization. They embrace both trade and benefit purposes, and take part in politics. The strikes among the Swiss unions from 1868 to 1873 inclusive varied from a few days to several months. In a fair proportion of cases the objects of the workmen were attained. In Italy trades unions have existed since about 1865, and several strikes have occurred. The strictness of the combination laws has depended a good deal on the pleasure of the tribunals charged with their execution. Coalition to raise or lower wages is made criminal only when entered into "unjustly or abusively," or "without reasonable cause." There are trades unions in other European countries, but they exercise little influence on industrial relations, and nowhere on the continent are these organizations so powerful as in the United Kingdom. While the laws of the continental countries repress combinations to raise wages, they encourage provident and mutual aid societies.—Though the working men of the United States have enjoyed unrestricted liberty of combination, the trades unions of this country do not compare with those of the United Kingdom in membership, resources, or discipline, nor in the extent to which they have combined beneficial objects with trade purposes. The following table comprises the principal unions with a national organization; all of these, except the miners' union, have branches in Canada:

NAMES OF SOCIETIES.	Date of organization.	No. of branches.	No. of members.
International typographical union...	1852	171	10,395
Machinists' and blacksmiths' international union.....	1850	....	8,000
Iron moulders' union of North America.....	1859	150	7,500
Brotherhood of locomotive engineers	1868	183	12,000
Journeyman tailors' national trades union.....	1865	40	2,800
Coopers' international union.....	1870	....	5,000
Cigar makers' international union..	....	100	5,000
Miners' national union.....	1878	347	85,355
United sons of Vulcan.....	1874	....	4,000

The miners' union comprises organizations which have existed for years in different states, of which the strongest was that of the anthracite miners of Pennsylvania. The membership of the national association is now distributed as follows: Pennsylvania, 20,840; Ohio, 4,734; Illinois, 5,122; Indiana, 2,185; Indian territory, 57; Iowa, 272; Colorado, 242; Wyoming, 544; Maryland, 481; Missouri, 547; Kansas, 123; Tennessee, 129; West Virginia, 178. The society of the "United Sons of Vulcan" comprises iron puddlers and iron boilers. The local unions are called "forges." In addition to the above there are the bricklayers' national union, the united order of American plasterers, the house painters, the hat finishers' association, the knights of St. Crispin (shoemakers), the order of morocco dressers, the journeyman horse shoers' union, the society of locomotive firemen, the mule spinners of the cotton factories, and the weavers, who in May, 1875, amalgamated their local unions into one association. There are also many local societies, some of which, especially among those in the larger cities, are of considerable importance. The financial panic of 1873 was followed by a large reduction in the membership of many of the unions. In New York city the aggregate membership in 1873 was 44,950; in 1874, 35,765. In 1871 the knights of St. Crispin had about 800 branches and 70,000 members; now they scarcely have a general organization, though many of the branches survive with a reduced membership.—In the national trades organizations of the United States, legislative power is confided to an assembly of delegates, to which each local union sends a number bearing a stated relation to its membership, and the action of these bodies is generally final. The principal exceptions are in the tailors' union and the iron moulders' union, in both of which questions are decided by a majority of the unions, and not as in England by a majority of individual voters. The assemblies of delegates elect the executive officers, usually for a term of one year. The qualifications for membership in the skilled trades usually include apprenticeship. In the typographical union the period required is four years. This union admits pressmen, and also charters local unions of pressmen. The iron moulders' union ad-

mits brass moulders on the same conditions as iron moulders, one of which conditions is the ability to earn the average rate of wages prevailing in the locality where the candidate is employed. The locomotive engineers require that the candidate shall be a white man, not less than 21 years of age, able to read and write, of temperate habits and good moral character, and possessing at least one year's experience as an engineer. The contributions in the American societies are generally small. Those of the tailors' union are but 10 cts. a month. Among the miners there is a strike fund, to which the contributions are 25 cts. a month. In several unions the initiation fees, and charges for new charters, travelling cards, &c., constitute the only sources of income for general purposes. In the brotherhood of locomotive engineers, the iron moulders' union, and some others, the benefit features, so largely developed in the English societies, appear to a limited extent. In most of the states the trades unions need legislation for the better security of their funds. The subject of a national law for this purpose, and also of legislation for the better protection of life in mining and other dangerous occupations, has been agitated. Nearly all of the societies above named declare themselves opposed to strikes except as a last resort, and several of them require their members to make an effort to settle disputes by arbitration, before applying to the society at large for authority to strike. A tendency toward federation has manifested itself among the trades unions of the United States, as in the organization of the workingmen's assembly of the state of New York, which however had but a brief existence. In February, 1876, an amalgamated association of iron workers was formed, embracing societies previously existing in different branches of the iron trade. The national labor union, organized at Baltimore in 1866, although assuming to represent the working men of the country, found comparatively little support among the trades unions, and gradually took the form of a political party. A national industrial congress was formed at Cleveland, O., in July, 1873. Besides an exchange of views between the representatives of the different industries, its objects included united action for legislation. Most of the large societies and many of the local unions were represented.—See Lemerrier, *Études sur les associations ouvrières* (Paris, 1857); Brentano, *Die Arbeitsgilden der Gegenwart* (Leipzig, 1871 et seq.); the count de Paris, *Les associations ouvrières en Angleterre* (French and English, 1869); Nadaud, *Histoire des classes ouvrières en Angleterre* (Paris, 1872); Leroy-Beaulieu, *La question ouvrière au XIX<sup>e</sup> siècle* (Paris, 1872); Bamberger, *Die Arbeiterfrage* (Stuttgart, 1878); and Mazaro, *Les chaînes de l'esclavage moderne* (Paris, 1876).

**TRADE WINDS**, the prevailing N. E. and S. E. winds, in the northern and southern hemispheres respectively, that blow from the par-

allels 30° N. and S. toward the equator. They are atmospheric currents moving toward the equator to fill the spaces left by the airs that have become heated and passed up to the more elevated portions of the atmosphere in the belt of the equatorial calms. These currents, moving continually toward larger parallels of latitude, do not at once acquire the increasing eastwardly movement of the portions of the earth's surface revolving beneath, and the lagging occasioned by the earth slipping away under them produces a deviation from a direct meridional movement as respects the surface of the earth, and an apparent progress of the currents toward the west. Beyond the limits stated above these currents merge into the regions of variable winds and calms. (See METEOROLOGY, and RAIN.) The trade winds have been known to Europeans since the end of the 14th century; to them Columbus owed his prosperous voyages to America, and they constitute a most important factor in the navigation of the ocean. The limits within which the trades prevail vary from month to month with the varying position of the sun, the range being about ten degrees. In general the trade wind is not accompanied by clouds, and the air is comparatively dry.—See MAURY'S, FITZROY'S, and ANDRAU'S trade-wind charts, the admiralty wind charts, and COFFIN'S "Winds of the Globe," to be published in 1876 by the Smithsonian institution; also FERREL'S "Motions of Fluids and Solids" (New York, 1860).

**TRAFALGAR** (anc. *Promontorium Junonis*), a cape of Spain, on the S. W. coast, at the N. W. entrance of the strait of Gibraltar, in lat. 36° 10' N., lon. 6° 1' W., about 28 m. S. E. of Cadiz. It is memorable for the naval battle fought near it, Oct. 21, 1805, between the English under Nelson and the combined fleets of France and Spain. (See NELSON, HORATIO.)

**TRAGACANTH.** See GUM, vol. viii., p. 321.

**TRAGOPAN,** a name given by Cuvier to the birds of the pheasant family comprised in the genus *ceriornis* (Swains.). The bill resembles that of the common fowl; the wings are ample and very concave, with the fourth to the seventh quills the longest; tail rounded, and its coverts ample; tarsi stout and armed with a small spur, anterior toes united at the base by membrane, and the claws long and curved. There are three or four species, inhabitants of the gloomy and thick pine forests of the high mountains of central Asia; they are solitary and shy, and discoverable only by their shrill whistle; the plumage is very brilliant, being red, varied with black, blue, and golden, and with white eye-like spots. The best known species is the horned pheasant (*C. satyra*, Swains.), of the size of a large domestic fowl; the males have the sides of the head naked, and in the spring behind each eye a long reddish and bluish horn directed obliquely backward, and under the throat long, naked, bluish, expansile wattles; the feathers are lengthened and disunited on the crown, pur-

plish black, becoming crimson on the occiput; back of neck and bare skin in front surrounded by deep black; wings and back brown with an eyed white spot at the end of each feather;

Horned Pheasant (*Ceriornis satyra*).

rest of plumage deep red with small spots of white; the female and young are brownish, and have neither the horns nor the wattles; the males do not attain the full beauty of their plumage till the third year. The food consists of grains, roots, insects, and larvæ. There are also the golden-breasted and black-headed tragopans, similar to the preceding.

**TRAGUS, Hieronymus**, the Latin name of a German botanist, whose real name was Bock, born at Heidersbach in 1498, died at Hornbach in 1558. He was successively head of a school in Zweibrücken and superintendent of the ducal garden, Protestant pastor at Hornbach, and physician of the count of Nassau in Saarbrück. He published *Neues Kräuterbuch vom Unterschiede, Wirkung und Nahmen der Kräuter, so im Deutschland wachsen* (fol., Strasburg, 1551; Latin translation by Kyber, 1552). This was the first attempt in modern times toward the classification of plants.

**TRAILING ARBUTUS.** See ARBUTUS.

**TRAJAN (MARCUS ULPIS TRAJANUS)**, a Roman emperor, born in Italica, near Seville, Spain, Sept. 18, A. D. 52, died in Selinus (afterward called Trajanopolis), Cilicia, in August, 117. He was the son of Trajanus, an officer in the imperial service, and early embraced the profession of arms. He served as a military tribune in the wars of the East, before 86 was made prætor, and in 91 became consul along with M. Acilius Glabrio. Afterward he went to Spain, and was sent by Domitian to Germany to command the troops on the lower Rhine. When at the close of 97 Nerva adopted him and chose him as his successor, the selection met with general acquiescence, although no previous emperor had been born out of Italy. His title after his elevation

to the imperial dignity was Emperor Cæsar Nerva Trajanus Augustus. In January, 98, Trajan, who was then encamped at Cologne, succeeded to the throne; but for many months he did not go to Rome, being engaged in war on the frontiers of the Rhine and the Danube. He entered Rome amid the acclamations of the people, and soon received, for his efforts to ameliorate the condition of the poor and to improve the judicature, the title of Pater Patriæ, and the new designation of Optimus. In 100 the younger Pliny, who was his warm personal friend, pronounced his panegyric upon him. In 101 Trajan crossed the Danube, defeated Decebalus, the Dacian monarch, took many of his strong posts and his capital Sarmizegetusa, and, having compelled him to sue for peace, returned to Rome in triumph with the title of Dacicus. In 104 Decebalus broke his treaty, refused to comply with the emperor's demand that he should surrender himself, and when Trajan marched against him first attempted to poison his enemy. The conquest of Dacia was now determined upon, and an immense bridge was built across the Danube, over which the Roman army passed into that country. This bridge was the largest work of the kind ever built by the ancients, and, according to Dion Cassius, consisted of 20 piers, 150 ft. high, 60 ft. wide, 170 ft. apart, and united by wooden arches; it was probably in the neighborhood of the modern town of Tchernetz in W. Wallachia. Decebalus was defeated at all points, and in despair killed himself (106); Dacia was reduced to the condition of a Roman province, and fortified posts were built and colonists settled in it (107). When the emperor returned to Rome, he exhibited to the people games which lasted 123 days, and in which 11,000 animals were killed and 10,000 gladiators fought. In the following years he carried on a campaign against the Parthians and Armenians, and was engaged in numerous military expeditions, the history of which is almost altogether lost. In the spring of 115 he marched against the Parthians, having previously received the submission of Armenia and the princes of the neighboring countries. He crossed the Tigris on a bridge of boats, subdued the country beyond that river, and returned to Antioch the same year. In 116 he again marched to the Tigris, and sailed down that stream to the Persian gulf, but was recalled by a general uprising in the provinces which he had reduced. Arriving at Otesiphon, he gave the Parthians a king whom they quickly expelled. After the siege of Atræ in Mesopotamia he fell sick, and, leaving his successor Hadrian in command in Syria, started for Italy, but died on the way. His ashes were carried to Rome in a golden urn, and placed under the column bearing his name, which he had erected in honor of his Dacian victories.—For many generations afterward Trajan's reign was looked upon as the most brilliant in the imperial annals. The Roman arms were carried further

than ever before or after, and rarely suffered defeat. Besides the conquests in Dacia and beyond the Euphrates, Arabia Petrea was made subject to the empire by A. Cornelius Palma, the governor of Syria. Nor were his works for the internal improvement of his dominions less important. He constructed an artificial harbor at Centum Cellæ (now Cività Vecchia), built the port of Ancona, made several great roads in various parts of the empire, one of which was across the Pontine marshes, and erected magnificent bridges. He founded several libraries in Rome, one of which, called *Ulpia Bibliotheca*, was very celebrated; built a theatre in the Campus Martius, and also the Forum Trajanum, his great work, in the centre of which was the column of Trajan, erected in 112. It has been alleged that he was intemperate and licentious. Many writers doubt the magnitude of the persecution of the Christians which is said to have taken place during his reign. His correspondence with the younger Pliny, governor of Bithynia and Pontus, concerning the treatment of Christians, displays an unusual consideration for justice and humanity. In his reply to Pliny he says: "You have adopted the right course, my friend, with regard to the Christians; for no universal rule, to be applied in all cases, can be fixed in this matter. They should not be searched for; but when accused and convicted, they should be punished; yet if any one denies that he has been a Christian, and proves it by action, namely, by worshipping our gods, he is to be pardoned upon his repentance, even though suspicion may still cleave to him from his antecedents. But anonymous accusations must not be admitted in any criminal process; it sets a bad example and is contrary to our age."

**TRALL, Russell Thacher**, an American physician, born in Vernon, Tolland co., Conn., Aug. 5, 1812. His parents removed to western New York in his childhood. He studied medicine, and for some time practised the profession in accordance with the standard system. In 1840 he removed to New York, where in 1843 he opened a water-cure establishment; and in 1858 he established a medical school for pupils of both sexes, called the "New York Hygieio-Therapeutic College," since removed to Florence, N. J. He has edited the "Hydropathic Review" and other periodicals devoted to hydropathy and temperance, and has published "Hydropathic Encyclopædia" (New York, 1852); "Hydropathic Cook Book" (1854); "Prize Essay on Tobacco" (1854); "Uterine Diseases and Displacements" (1855); "Home Treatment for Sexual Abuses;" "The Alcoholic Controversy;" "The Complete Gymnasium" (1857); "Diseases of the Throat and Lungs" (1861); "Handbook of Hygienic Practice" (1865); "The True Temperance Platform" (1864); "Sexual Physiology" (1866); "Water Cure for the Million" (1867); "Digestion and Dyspepsia" (1874); "The Human Voice" (1874); and "Popular Physiology" (1875).

**TRANI**, a town of S. Italy, on the Adriatic, in the province and 27 m. W. N. W. of the city of Bari; pop. in 1872, 24,888. It is the seat of an archbishop, and has an ancient and celebrated cathedral with one of the loftiest towers in Italy. The harbor was formerly very deep, but is now accessible only to small vessels. The trade is chiefly in oil, wine, grain, almonds, and figs.

**TRANQUEBAR**, a town of British India, in the district of Tanjore, Madras, on an island at the mouth of the river Cavery, 147 m. S. by W. of Madras; pop. about 25,000. There are Lutheran churches, a Roman Catholic chapel, and several schools. Tranquebar has some manufactures of cotton cloth, oil, and soap. It belonged to the Danes, but was ceded to the British in 1845.

**TRANSCAUCASIA**. See CAUCASUS.

**TRANSCENDENTAL** (Latin *transcendere*, to go beyond), in metaphysics, a term applied in general to ideas and doctrines that are not suggested or limited by experience. In the scholastic philosophy, *transcendens* and *transcendentalis* designated anything that was not *prædicamentalis*, that is, anything that rose above, was not comprehended in, and could not be defined by, either of the ten *summa genera* or categories of Aristotle. Thus, being was transcendental, and only some category of being was prædicamental. Kant gave new and distinct significations to *transcendens* and *transcendentalis*. The former designated what is wholly beyond experience, is conceivable neither *a priori* nor *a posteriori*, and thus lies beyond every category of thought. The latter designated *a priori* conceptions and judgments, which are necessary and universal, and which transcend the sphere, while affording the conditions, of the contingent knowledge furnished by experience. Thus by the transcendental, formal, or critical philosophy of Kant is meant his system of the principles of the pure reason, which occupies itself not with the objects or matter of knowledge, but with the subjective ideas or forms, as time, space, substance, and causality, through which objects are represented to us as phenomena. Objects in themselves (*Dinge an sich*) he deemed transcendent. —In mathematics, transcendental quantities are those which cannot be expressed by a finite number of algebraic terms, but are represented by means either of logarithms, or variable exponents, or some of the trigonometrical functions. Transcendental curves, as the logarithmic spiral, are those whose equation is transcendental, *i. e.*, expresses a relation between transcendental quantities.

**TRANSFUSION OF BLOOD**, the operation of introducing into the vascular system of one animal blood taken from the vessels of another. This operation was suggested and described by Libavius early in the 17th century, but it was first successfully practised by Richard Lower in England in 1665. Some years previously it had been ascertained by Robert Boyle that

various medicinal substances might be injected directly into the blood vessels of the living dog, with the result of producing their specific effect upon the animal system, as if they had been introduced by the stomach. Lower's experiments were also performed upon the dog, by connecting, by means of a tube, the carotid artery of one animal with the jugular vein of another, the vein of the second dog being allowed to remain open above the point of connection. Thus the blood lost by the second dog was supplied by that coming from the carotid artery of the first. The consequence was that the animal into whose vessels the blood was introduced in this way by transfusion remained uninjured, while the other died of exhaustion from hæmorrhage. These experiments encouraged the idea of performing a similar operation upon the human subject. This was first done in France in 1666 by Denys and Emmerets. They believed that the operation might result in the cure of chronic diseases by introducing into the veins of the patient healthy blood from a foreign source; and accordingly they transfused the blood of a sheep for this purpose into a man. The first results were said to have been so favorable as to excite the most extravagant anticipations, and to create great enthusiasm in the minds of the medical profession in favor of the operation. But these promises were not fulfilled, and as several instances occurred soon afterward where the operation was followed by bad consequences, there was a corresponding reaction against it, and in 1668 the parliament of Paris forbade its repetition except by special consent of the faculty. In 1818 the operation of transfusion was again taken up by Dr. Blundell of London, who carefully experimented upon it as applied to its original and legitimate object, namely, the restoration of life after exhausting hæmorrhage. He performed 38 experiments upon dogs, and established by them the following facts: 1, that dogs, when exhausted by hæmorrhage, may be resuscitated, even after momentary stoppage of the respiration, by injecting the blood of other dogs; 2, that human blood injected into a dog, in sufficient quantity to supply the loss caused by abundant hæmorrhage, produces a temporary reanimation, but does not save life, as the dog dies some hours afterward; 3, that the transfusion of blood, whether arterial or venous, will be successful if the two animals belong to the same species; 4, that the blood used in transfusion need not be conveyed directly from the vascular system of one animal to that of the other, but may be received into a cup and passed through a syringe, without being thereby rendered unfit for the purposes of life. The operation was thus placed upon its proper footing, and one of the important conditions for its success brought into notice; namely, that the blood used for transfusion should belong to an animal of the same or at least a kindred species. This explained in great measure the

bad results of the earlier operations, in which the blood of the sheep had been introduced into the veins of the human subject. This fact was still further elaborated by subsequent experimenters. If the animals used for experiment belong to different classes, as where the blood of a quadruped is introduced into the veins of a bird, or that of a bird into the veins of a quadruped, even in small quantity, it appears to have an actually poisonous effect, and death follows in a very short time. If the animals belong to the same class, but are not of the same genus, as where the blood of the cow or the sheep is introduced into the vessels of the cat or the rabbit, or human blood into those of the dog, there is a temporary reanimation, but noxious effects afterward follow, and death occurs at the end of some days. These noxious results appear to be due in great measure to the presence of the fibrine of the blood; for if this be removed by beating the fresh blood before its injection, they do not follow, or at least are much less strongly marked. Nevertheless, the blood of animals belonging to a different class, even when defibrinated, though no longer actually poisonous, does not resuscitate or preserve the animal experimented on from the effects of hæmorrhage. To secure this beneficial effect, the animals must be within certain limits of consanguinity. If the blood be used fresh, they must belong to the same species; and if it be defibrinated, they must still belong to the same genus. Furthermore, it is found that the red globules of the blood are essential to its vivifying influence. The fibrine may be removed without injury, and in some cases, as above mentioned, even with benefit. But the injection of serum alone, that is, blood deprived of both fibrine and globules, is useless as a means of preserving life.—With these improvements the operation of transfusion has been successfully applied to the human subject. After an abundant hæmorrhage there is frequently an interval, often of several hours, during which, although the hæmorrhage may have ceased, the patient is evidently sinking, and other means of restoration are of no avail. It is to such cases that the operation of transfusion is adapted. Bérard has recorded 14 instances of this kind, most of them cases of hæmorrhage after delivery, in which the life of the patient was saved by this means. There are certain rules which it is important to observe: 1. In transfusion in the human subject, it is of course human blood that should be used, supplied by a healthy, vigorous person. 2. But a small quantity, namely, from two to four ounces, should be injected at a time. This amount is generally sufficient; if not, the injection may be repeated after an interval. All that is required by the transfusion is to restore the patient to consciousness and bring him into such a condition that he can take and appropriate nourishment and stimulus. 3. If the injection be made by a syringe, great care should

be taken that the blood be not allowed to fall below its natural temperature of 100° F., and especially that no bubbles of air become entangled with it and thus introduced into the veins. 4. The injection should be made slowly, and terminated as soon as the requisite effect has been produced. 5. The delay should not be so great as to incur the risk of the blood becoming coagulated, either in the syringe or within the veins of the patient.

**TRANSIT**, in astronomy, the passage of a planet across the disk of the sun, or of a satellite across the disk of its primary; also, the passage of a heavenly body across the meridian of the place of observation, sometimes called its culmination. Of the planets, only Mercury and Venus, having orbits within the orbit of the earth, can present this phenomenon. The transits of Venus are employed for the determination of the sun's distance; they recur at alternate intervals of 8 and 105½, and 8 and 121½ years. The earliest transit of the sun's disk of which we have an account is that of Venus in 1639, predicted and observed by Jeremiah Horrox, an amateur astronomer of Lancashire, England. The transits of the last century, in the years 1761 and 1769, were observed with great care, expeditions having been equipped for the purpose by the chief European states. But the results then obtained were not so trustworthy as had been anticipated. Two methods of observation were relied on, both depending on time, though not in the same way. It had been suggested by Halley, early in the century, that instead of observing the position of Venus on the sun's face at any assigned instant (for the purpose of thence determining her relative parallax displacement and so her distance), the observers should note the interval of time occupied by the planet in completing her transit. As the effect of parallax would be to cause her to traverse different chords, as seen by observers at northern and at southern stations, there would result a difference in the duration of transit, the amount of which would enable astronomers to deduce the sun's distance. Delisle, when the transit of 1761 was approaching, discovered that there would be on that occasion disadvantages in applying Halley's proposed method, which requires that both the beginning and end of the transit should be seen; and he proposed another method, requiring only that one or other of these phases should be noted. According to this plan, two observers were both to note the beginning (or else both to note the end), one observing the phase where it occurred as early as possible, and the other observing it where it occurred as late as possible; then, by noting the difference of time between their two observations, they would be able to estimate the sun's distance. Halley's method was manifestly the easier, since each observer had to note the duration between two phenomena both of which were observed by him, and the difference be-

tween the two durations thus noted could be determined at once; whereas in Delisle's method each observer had to determine the absolute time of a single phenomenon, and a comparison between their results could only be effected satisfactorily if these results could be referred to some common standard time of reference, as Greenwich or Paris time. But in the actual application of both methods another difficulty obtruded itself into notice. It was found that the moment when Venus was in internal contact, either at ingress or egress, could not be determined, as Halley had hoped, within a single second, or indeed within several seconds. Accordingly doubt had long rested on the determination of the sun's distance obtained from the observations made in 1761 and 1769. In fact, from the first, the results were found to be widely discordant according to the manner in which the observations were interpreted. The values of the sun's distance deduced from the transit of 1761 ranged from 77,846,000 m. to 96,163,000 m.; those deduced from the transit of 1769, though not ranging quite so widely, yet differed by more than 4,000,000 m., the greatest being as before 96,163,000 m., the least 92,049,650 m. Strangely enough, all this was forgotten when (after Encke had published his result from the combination of both series of observations, viz., 95,265,000 m.) a long period had elapsed during which the text books and ephemerides had published the same value for this important element. Accordingly, much surprise was expressed when other methods of observation showed that this value so long received was too great by three or four million miles, the true value appearing to be nearer 92,000,000 m. Although this surprise was by no means justified by the facts of the case, yet it was natural that much attention should be attracted to the transits of 1874 (Dec. 8) and 1882. Accordingly great preparations were made for the observation of the earlier transit, the United States in particular taking a distinguished part in the work. It has been estimated that nearly \$1,000,000 must have been expended on the various expeditions. Stations were occupied in Siberia, China, Japan, the Hawaiian islands, northern India, Persia, Turkistan, and Egypt in the northern hemisphere, and at a number of islands in the Indian and Southern oceans, from Kerguelen on the east to Chatham island and New Caledonia on the west, Australia, Tasmania, and New Zealand being also occupied in force. Various success attended the observers, but on the whole the results obtained were excellent. Delisle's method and Halley's, the heliometric method, and photography were applied at many of the most important stations; and though bad weather prevailed at other stations, the object of the expeditions was achieved. So far as can be judged at present, the sun's distance indicated by these observations is about 92,000,000 m. The next transit of Venus will occur Dec. 6, 1882, and is looked forward to with great interest for

verifying these determinations.—The transits of Mercury are much more frequent than those of Venus, in consequence of the former planet being nearer the sun, and having thus a narrower orbit and a shorter year; but they are not available for the determination of the solar parallax. The transit of stars is employed in the determination of longitude. (See *LOWER-TUDE*.) The precise relative situation of the heavenly bodies in respect to their right ascension is determined by comparing their exact times of transit. For the means by which these times are ascertained see *TRANSIT CIRCLE*.

**TRANSIT, Engineer's.** See *THEODOLITE*.

**TRANSIT CIRCLE**, an astronomical instrument for determining the absolute positions of the heavenly bodies. As these positions are given by two independent elements, the right ascension and declination, corresponding to geographical longitude and latitude, so this instrument is a combination of two independent

Transit Circle.

constructions, each giving its share to the name of the whole, and each furnishing its corresponding element by independent and yet simultaneous observation. The transit circle now forms an essential part of the equipment of every well constituted observatory. The two constructions which have here combined their powers are the transit instrument and the meridian or vertical circle. The former consists of a telescope whose tube is composed of two slightly conical portions firmly secured at their bases to opposite sides of a hollow central cube, from two other opposite sides of which proceed also equal cones of more massive make, generally indeed cast in the same piece with the cube, and forming an axis at right angles with the telescope. At or near the extremities of this axis are two perfectly cylindrical, highly finished pivots of hardened steel, corresponding in position to sockets resting upon stone columns which, based firmly in the ground,

exactly east and west of each other, and rising to a convenient height, support the instrument so that the telescope revolves freely between them in the plane of the meridian. This gives the simple transit instrument, by which and its necessary accompaniment, the clock, is observed the time of meridian passage (the transit) of the star whose place is to be determined. If now we attach firmly to the axis a finely graduated circle which will revolve with the telescope, we shall be enabled, by means of its divisions, to measure also the precise altitude of the star at the same instant of culmination; and thus the transit circle will give, by the first observation, the desired right ascension, and by the second, the desired declination of the object. This combination is entirely of modern date. Transit instruments and meridian arcs and circles have been used ever since the days of Roemer and Picard, but the first real conjunction of the two dates from the close of the first quarter of the present century.—The sockets of the transit circle receive the pivots and determine the position of the instrument. They are not formed, as might be supposed, of circular “boxes” accurately fitting the pivots, but are simply solid little pieces of gun metal, cut away at the upper surface by two planes inclined to each other like the sides of the letter V, from which letter they take their technical and convenient name. In these V's the pivots revolve smoothly and truly, touching the inclined sides at but two points, and consequently without the lateral play which it would be impossible to avoid in circular boxes, however truly ground. Again, the stone piers upon which the instrument rests, even though wrought into perfect symmetry and equality in every respect, and though posited in such a manner as to furnish no apprehension of relative change, will yet continually manifest such change, sometimes under the influence of varying temperature from day to night and night to day, but more frequently from causes even more irregular and less known than this. In order therefore to be able to keep the axis of the instrument duly east and west and truly horizontal, the V's are not permanently bedded in the stone, but are so held by strong plates of the same material, themselves permanently fastened, as to allow of small changes of position, one in a horizontal and the other in a vertical direction. Passing next to the telescope, we notice that the narrower ends of the tapering tubes are terminated by flat rings of precisely the same dimensions, upon which are fitted caps containing, one the object glass and the other the eye tube with its mechanisms. These caps are exactly of equal weight, and, partially entering the ends of the tube, their centres of gravity fall truly in the line of junction with the telescope. Thus the instrument is not only perfectly counterpoised, but also, the caps being convertible, the object glass and eye tube may be and should be periodically interchanged, in order to eliminate

from an average result the effect of a possible flexure of the tube. The object glass presents nothing worthy of especial remark. The construction of the eye piece is peculiar. The term “eye piece” is generally, though incorrectly, applied to the whole mechanism at the eye end of the telescope, which consists of a small tube sliding in the end cap, and carrying not only the eye piece proper, which is of the form known as Ramsden's (see TELESCOPE), but also a conveniently shaped box containing two thin metallic plates. These plates, called diaphragms, are made with central openings, across which are stretched the threads used to mark the star's position in or its progress through the field. One of these diaphragms is used for the observation of transits, and is securely held in place by fine “antagonist” adjusting screws. Across its opening and precisely through the centre of the field is stretched vertically a most delicate thread of spider's web, which, as the instrument revolves, represents to the observer's eye the meridian as a visible line across which the heavenly bodies are seen to pass at the moment of culmination. In order to gain more accuracy in this observation (for the instant of transit is required to be known within a small fraction of a second), other threads are also introduced parallel with the central one and symmetrically disposed on either side of it, so that, by noting the time of crossing each and taking the average, a very great degree of accuracy is attained. Ordinarily the transit diaphragm contains either five or seven threads, all at equal intervals; but for special purposes their number and arrangement are adapted to the circumstances. With a telegraphic method of registry, as practised with the large transit instrument of the Washington observatory, five different sets or tallies, with five threads in each, are sometimes used. Across the same diaphragm is stretched horizontally another fixed thread, as a guide to the observer in placing the telescope so that the star shall traverse the centre of the field. The second diaphragm, carrying only a single horizontal thread, is movable in a vertical direction between truly fitting guides, and by means of a finely wrought micrometer screw. As the first plate belongs to the transit portion of the twofold construction, so this one belongs to and coöperates with the circle, and the office of the screw which carries it is to measure the exact distance of the star, as it traverses the field, either from the fixed horizontal thread, or from some other definite starting point, which may be represented upon the scale of the screw without being necessarily visible. Attached to the screw and revolving with it is a small disk or “head,” whose edge is divided into 100 equal parts, so as to measure very accurately the fractions of a revolution, while the whole number of turns necessary to carry the thread to any part of the field is registered upon a convenient scale usually placed within the eye

piece and visible with the threads themselves. In order to render thread and scale visible by night, various contrivances are used, the most common of which is to introduce a flat oval ring with whitened surface into the central cube, and with its plane inclined at an angle of  $45^\circ$  with the axis, so that, receiving light thrown in through an orifice in the pivots, it will reflect sufficient into the field to show the threads as black lines upon a bright ground. Sometimes also the illumination is thrown upon the threads themselves, when they appear as bright lines upon a dark ground; and in the great transit circle at Greenwich a very ingenious combination of prisms enables the observer to produce either effect at pleasure.—Upon each half of the axis, between the cube and the pivots, is a circle whose diameter is usually from one third to one half the length of the telescope. These circles with their several radii and cross bars are generally cast each in a single piece, to insure greater firmness and avoid unequal tensions. But the six-foot circles of the Greenwich instrument just mentioned, weighing about 300 lbs. each, are made of two castings, the rim in one, and the whole system of radii and braces in another, the two being afterward firmly bolted together at 12 equidistant points. Upon a narrow band of silver inserted near the circumference of the circles are cut the graduations required for the special office of each; one, used only for pointing the telescope in any given direction, is divided so as to read with a vernier to single minutes, which is abundantly sufficient; the other circle, intended for the exact measurement of angles, is divided with the most scrupulous accuracy into arcs of two, three, or five minutes, as the case may be, and, once fixed upon the axis, should never during observations be handled or subjected to unequal pressure or strain of any sort. Assuming now that these division marks are truly cut, we next look for the means of subdividing the small arcs into seconds and fractions of seconds, and find this accomplished by a system of "reading microscopes." These are microscopes of the ordinary compound construction, but each provided with a micrometer screw carrying, as in the German instruments, a pair of close parallel threads between which the image of the division under consideration can be placed with great accuracy, or, as in Troughton's form, two threads crossing each other at a very acute angle, which may be bisected by the division. The microscopes are so made that one revolution of the screw is equal to a minute, and the micrometer head is divided into 60 equal parts, each of which therefore represents a second. There are usually four of these microscopes placed 90 degrees apart; but sometimes as many as six are used for greater certainty, both from the greater number of readings and from the probable reduction of the systematic errors of the primary division. The proper method of supporting these microscopes to insure their

perfect stability has been a subject of much study. A favorite plan has been to place them on the periphery of another smaller circle which rests, accurately fitting, upon the axis itself, but is prevented from revolving with it by a small projecting bar caught below between two screws attached to the pier. Experience, however, seems to have decided in favor of securing firmly and independently upon the pier itself, near the V-plate, a solid block of metal which serves as the centre of a strong square frame at whose corners the microscopes are attached by adjusting screws. The microscopes are thus entirely disconnected from the circle; and although every new adjustment of the axis will show itself in their record of the graduations, yet this produces no effect whatever upon the mean of readings of opposite microscopes. In the Greenwich instrument, whose piers are broader than the circles themselves, the microscopes are very long, and are passed through the pier itself, converging from the rim of the circle until their eye pieces are collected within a very small space, where the observer reads them with convenience and ease. The graduated limb is bevelled to suit this arrangement, and from another point near the observer a small gas-burner radiates light through other openings in the pier in such a manner as to illuminate uniformly the field of each microscope; a matter of very high practical importance.—To bring the instrument into its proper place in the meridian, it is necessary that the middle vertical thread of the fixed diaphragm be placed truly in the optical axis of the telescope, which is the central line of the cone of rays converging from the object glass. This may be effected by turning the telescope to a very distant fixed object, noting the exact position of this middle thread with reference to the images in the field, and then reversing the instrument, when the thread will probably occupy a different position, whereupon it must be brought by the adjusting screws of the diaphragm to a point midway between the first and second places, and the operation repeated until no change appears upon reversal. Next, by means of a spirit level and the vertical adjusting screws of one of the V-plates, the axis of the instrument is rendered truly horizontal; and finally, the approximate sidereal time being known, the telescope is directed to some star, also known, very near the pole of the heavens, and the axis moved by the horizontal adjusting screws of the other V-plate, until at the right moment the star and thread coincide exactly. The three errors thus corrected are denominated the errors in collimation, level, and azimuth respectively. And now, by help of stellar observations under properly varied circumstances, we are able not only to determine with great precision the small outstanding values of these errors, which by no means remain constant for any length of time, but also to judge the clock that aided us, and finally the

very places of the stars that have served as our guides. The errors of instrument and clock having been thus determined, it is possible, by the aid of formulas and methods which have been so thoroughly developed and systematized as to be applicable with the greatest facility, to obtain by a single observation of any new object its right ascension within a very small fraction of a second of time.—But, as we have intimated, the chief value of the instrument consists in its power of furnishing at the same culmination not only the right ascension but also the declination of the object, and it accomplishes the latter most simply in the following manner. While the observer is noting the progress of the star across the transit threads, he at the same time, by a delicate movement of the telescope in altitude, places it so that the star appears to run along the fixed horizontal thread; and then, the transit observation having been completed, he reads, even to the fraction of a second, from the circle microscopes the precise point corresponding to the apparent altitude of the star. Or, a still more accurate determination is obtained by placing the telescope so that the star will traverse the field at a little distance above or below the fixed thread; and there is ordinarily time enough to bring the movable thread several times into coincidence with the star's image by means of the micrometer screw, always noting its indications and afterward taking the mean of all. The small distance from the fixed thread, as thus measured, must of course be duly applied as a correction to the readings of the microscopes, and thus we derive one extremity of the desired arc, and then proceed to find the other. In order to know the star's declination, we must first have its altitude above the horizon. This can sometimes be obtained by a double observation of the star's image, first as reflected from a quicksilver surface, and then as seen directly, in which case the arc included between these two directions is obviously equal to twice the altitude of the star; but this course is not always applicable. We have however a readier and exquisitely beautiful method of obtaining with very great accuracy the direction of the vertical line, from which we can count the star's zenith distance. The telescope being turned so as to look directly downward, we place immediately beneath it a vessel of quicksilver; and if then, by means of a small plate of thin glass held at an angle of  $45^\circ$ , we reflect a strong light down the telescope, it will be reflected back by the quicksilver, and, looking through the glass from above, we shall see not only the threads in the eye piece, but also the reflected image of each; and by moving the instrument carefully until the fixed horizontal thread coincides with its own image, we shall have the telescope mathematically vertical, and may read from the circle the corresponding second point of the desired arc, whereby we obtain the apparent altitude, and thence, cor-

recting for refraction, the true altitude, and finally the desired declination.—A few words must be added respecting the use of transit instruments in the prime vertical, that is, so placed that the great circle described by the collimation axis is in the prime vertical. Bessel first suggested this method of mounting a transit instrument, for the purpose of determining with special accuracy the latitude of the place of observation. It is manifest that any star which has a north declination less than  $l$ , where  $l$  is the latitude, crosses the prime vertical at equal altitudes on the eastern and western quadrants. If the interval in time between these passages be noted as  $=2t$ , it is manifest from the right-angled spherical triangle having for its angles the pole, the zenith, and the star's place in either quadrant of the prime vertical, that  $\tan l = \tan \delta \sec t$ . This method of determining the latitude has a great advantage in the readiness with which instrumental errors may be got rid of, by using the instrument alternately in opposite positions as respects the rotation axis. The adjustments for a transit instrument in the prime vertical relate, like those of the meridional transit instrument, to the three points, collimation, level, and azimuth. In collimation the adjustment resembles that of the ordinary transit instrument. The instrument is brought nearly into the prime vertical by directing it to a star of small northerly declination at the calculated time of the star's passage of the prime vertical. When this has been done, the rotation axis must be carefully levelled, and a fresh adjustment made by means of another star. For the small adjustment thus rendered necessary provision is made by allowing one of the V's a small motion in azimuth. Another method is to have the instrument provided with a graduated horizontal circle, and then, having adjusted it in the meridian, to revolve it through  $90^\circ$  in azimuth. When the rotation axis is in the meridian but inclined to the horizon, a correction can be readily made for this inclination, because the great circle described by the collimation axis crosses the horizon at the true east and west points, but passes slightly to the north or to the south of the true zenith; and the latitude found by means of the instrument corresponds to the latitude of the point where the great circle thus swept out crosses the meridian. Thus the only required consideration of the level correction is that this correction should be applied directly to the latitude found from the instrument used as if correctly adjusted. But if the rotation axis is neither in the meridian nor level, or if the middle thread is not in the collimation axis, the correction is less simple. (See Chauvenet's "Spherical and Practical Astronomy," vol. ii., p. 242.)

**TRANSUBSTANTIATION.** See LORD'S SUPPER.

**TRANSVAAL REPUBLIC.** See BOERS.

**TRANSYLVANIA** (Hun. *Erdély*; Ger. *Siebenbürgen*), a grand duchy of the Austro-Hun-

garian monarchy, now forming part of the lands of the Hungarian crown, bounded W. and N. by Hungary proper, N. E. and E. by the Bukowina and Roumania, and S. by Roumania. It is situated between lat.  $45^{\circ} 12'$  and  $47^{\circ} 42' N.$ , and lon.  $22^{\circ} 24'$  and  $26^{\circ} 30' E.$ ; area, according to the last changes of the frontiers, 21,216 sq. m.; pop. in 1870, 2,115,024. Capital, Klausenburg. The country is surrounded on all sides by mountains belonging to the Carpathian system, and the surface is much diversified, being traversed by several mountain ranges, between which there are numerous fine valleys and plains. The principal chain extends along the E. and S. frontiers, and sends out many offsets. The range which forms the N. W. boundary toward Hungary is properly designated as the Transylvanian Ore mountains. The most elevated points lie near the S. boundary, in the so-called Transylvanian Alps, where Mt. Negoi has a height of more than 8,000 ft. above the sea, and Mt. Buceşed is very little lower. The Tömös, Red Tower, and Vulcan passes lead through this range. The whole drainage belongs to the basin of the Danube, the chief rivers being the Aluta (Hun. *Olz*), the Maros with its tributaries the Great and Little Kokel (*Küküllő*), the Bistritz (*Beszterce*), the Szamos, and the Körös. There are several lakes.—The climate varies greatly according to elevation. In the valleys the heat of summer is very great, but in the more elevated districts the winter temperature is remarkably severe and so long continued as to cause serious injury to vegetation. Gold is found in most of the streams in greater or less quantities; a number of gold mines are worked, and are said to be very productive. Silver mines are also worked, and there is one of quicksilver. Copper, lead, iron, antimony, arsenic, tin, coal, alum, bitumen, saltpetre, and salt are all found; together with crystals and valuable pebbles, including garnets, chrysolites, amethysts, chalcedonies, agates, carnelians, and jaspers. A bed of rock salt extends in a belt 60 to 80 m. wide through the whole country, from which great quantities are extracted, as well as from numerous springs. In the more elevated parts vegetation is scanty, but lower down luxuriant forests make their appearance, which yield many kinds of valuable timber. The valleys and plains are particularly fertile, and, although agriculture is in a backward state, yield good crops of various kinds of grain, pulse, maize, hemp, flax, tobacco, saffron, and madder; and the vine and fruits are very generally cultivated. Great numbers of horses, horned cattle, buffaloes, sheep, and pigs are reared, large herds of the last named being fed in the forests. Game is abundant, and the rivers are well supplied with fish. The manufactures consist principally of coarse linen and woollen goods, native silk, different kinds of metals, paper, gunpowder, leather, porcelain and earthenware, glass, stearine candles, soap, furniture, and numerous articles in wood.—The population is composed of various races,

including Magyars or Hungarians proper, Szeklers, Saxons, Roumans or Wallachs, Ruthenians, gypsies, Armenians, Greeks, Jews, and Bulgarians. The Roumans are by far the most numerous, being about three fifths of the whole. The gypsies number about 88,000. The religions most numerously professed are the non-united and united Greek (chiefly by the Ruthenians and Roumans), Roman Catholic (by the Magyars), Calvinist (by the Magyars), Lutheran (by the Saxons), and Unitarian (by the Szeklers). The Magyars and Saxons have the best schools; those belonging to some of the others are of a very inferior character. The first Transylvanian university was opened at Klausenburg in 1872. The Szeklers, or properly Székelys, who are believed by some to be descendants of the Huns, and by others of the Petchenegs and other tribes kindred to the Magyars, use a dialect little different from the language of the latter, this being also spoken by the Bulgarians and Armenians. The Saxons are descendants of German settlers from Flanders, the lower Rhine, the Hartz, and Thuringia, who established themselves in Transylvania especially about the middle of the 12th century, where they are unmixed with other races, and speak their own language, the German. They formerly enjoyed various privileges, based chiefly on a charter granted them by King Andrew II. in 1224, and more equality of rights than the other races. Together with the Magyars and Szeklers they formed the constitutionally ruling people, but now all nationalities enjoy equal rights. The country is therefore divided into the lands of the Hungarians (chiefly in the northwest and west), of the Szeklers (in the east), and of the Saxons (in the south and northeast). The land of the Hungarians is subdivided into the counties or comitats (*megyék*) of Klausenburg (*Kolozs*), Doboka, Inner Szolnok, Thorda, Kokelburg (*Küküllő*), Upper Weissenburg (*Fejérvár*), Lower Weissenburg, and Hunyad, and the districts of Fogaras and Nászod; the land of the Szeklers into the seats (*székek*) of Aranyos, Maros, Udvarhely, Csik, and Három-Szék; and the land of the Saxons into the seats (*Stühle*) of Hermannstadt, Broos, Mühlenbach, Reissmarkt, Mediasch, Schässburg, Gross-Schenk, Leschkirch, and Reps, and the districts of Kronstadt and Bistritz. Besides the capital, the most important towns are Hermannstadt, Kronstadt, Vásárhely-on-the-Maros, Bistritz, and the fortress Carlsburg. The constitution of Transylvania before the revolution of 1848-'9, during which it was reunited with Hungary, resembled that of the latter country, but was more complicated, owing to numerous reserved privileges. It was abolished by the Austrians in 1849, and restored in 1861, though not in its full vigor. In 1867 Transylvania was again fully united with Hungary, and its separate diet abolished.—Transylvania in the time of the Roman empire belonged to Dacia, was subsequently overrun by the Huns, Goths, Gepidae, Lombards, Bulga-

rians, Avars, Petchenegs, and other tribes, and in the 10th and 11th centuries conquered by the Hungarians, who ruled it by waywodes, for a time disputing its possession with the Cumans. Having shared the fate of Hungary for centuries, it became an independent principality during the Turkish-Austrian wars in the early part of the 16th century, and was ruled among others by the Zápolyas, the Báthoris, Bocskay, Bethlen, the Rákóczy, and the Apafis, until it was finally annexed to Austria in 1713. (See HUNGARY, vol. ix., pp. 57-61, BATHORI, BETHLEN, RÁKÓCZY, and ZÁPOLYA.) The antagonism between the Roumans and Magyars, which in 1848 led to a bloody rising of the former, has not entirely subsided, and more or less secret agitations in favor of a union of Transylvania with Roumania, the united countries to form a strong Dacian realm, not unfrequently alarm the Hungarian government. The Saxons, too, hold themselves in opposition to the leadership of the Hungarians. On the E. and S. frontiers the people down to a late date held their land under the tenure of protecting the country against foreign aggression in these directions, the hardy and warlike Szeklers in the east constituting the principal strength of this military frontier organization.—See "Transylvania, its Products and its People," by Charles Boner (London, 1865), and *Voyage aux régions minières de la Transylvanie occidentale*, by Elisée Reclus (Paris, 1878).

**TRANSYLVANIA**, a S. W. county of North Carolina, bordering on South Carolina; area, about 475 sq. m.; pop. in 1870, 3,586, of whom 309 were colored. It contains the sources of the French Broad river, and is almost entirely surrounded and occupied by mountains. The soil of the valleys is fertile and well adapted to stock raising. The chief productions in 1870 were 12,476 bushels of rye, 95,683 of Indian corn, 8,142 of Irish and 8,101 of sweet potatoes, 18,844 lbs. of wool, 6,301 of tobacco, and 24,129 of butter. There were 504 horses, 1,197 milch cows, 2,712 other cattle, 4,721 sheep, and 6,490 swine. Capital, Brevard.

**TRANSYLVANIA UNIVERSITY.** See LEXINGTON, Ky.

**TRAP** (Swed. *trappa*, a stair), a class of volcanic rocks, so named because of the stair-like appearance they often present. There are several kinds of trap rocks, distinguished by their chemical composition and physical character. They are composed mainly of feldspar and hornblende, in varying proportions and states of aggregation, with sometimes augite, chrysolite, and other minerals in smaller quantities. The most important among the trap rocks are the basalts, amygdaloids, greenstones, and dolerites. They are therefore chiefly divided into felstone traps and hornblende traps, the principal variety of the latter being greenstone. Hypersthene rock is made up of Labrador feldspar and hypersthene, a variety of hornblende; it is abundant in the isle of Skye.

**TRAPANI.** I. A province of Sicily, comprising the W. extremity of the island, bounded E. by Palermo and Girgenti, and on the other sides by the Mediterranean; area, 1,214 sq. m.; pop. in 1872, 236,388. The coast line is irregular, and there are several bays, the largest of which is the gulf of Castellamare. The most important of the numerous islands off the W. coast are the three anciently called the *Ægates*, viz., Favignana, Levanzo, and Maritimo. The surface of Trapani is traversed by several offsets from the Madonian mountains. The soil is generally fertile. II. A city (anc. *Drepanum* or *Drepana*), capital of the province, on a peninsula which extends into the Mediterranean, 46 m. W. S. W. of Palermo; pop. in 1872, 33,684. It has a small harbor protected by a fort. The churches are exceedingly numerous, and there is a lyceum, a gymnasium, and an archaeological museum endowed in 1875 by Cavaliere Depoli. The salt works and fisheries are of some importance.—*Drepanum* was founded by Hamilcar during the first Punic war, about 260 B. C., who transferred hither the inhabitants of the neighboring Eryx; and it remained one of the chief strongholds of the Carthaginians throughout this war. Off its port they gained a great naval victory under Adherbal in 249, destroying nearly the whole Roman fleet; and it was in attempting to raise its siege by the Roman consul Catulus in 241, that their ships under Hanno suffered off the island of Favignana (anc. *Ægusa*) the defeat which ended the war.

**TRAPEZUS.** See TREBIZOND.

**TRAPPISTS**, a branch of the Cistercian order famed for the austere reform inaugurated by De Rancé, abbot of La Trappe. (See RANCÉ.) This monastery is near Mortagne, in the French department of Orne. It was founded in 1140 by Rotrou II., count of Perche, who gave it to a colony of Benedictine monks from Savigny. In 1148 St. Bernard affiliated it to Clairvaux, and its inmates became famous for piety. During the incessant wars between the French and the English, the monks were frequently plundered and dispersed, till toward the close of the 15th century their long enforced absence from the monastery gradually weakened the habits of regular observance, and reduced their numbers to less than 20. Francis I. gave the ruined abbey in *commendam* to Cardinal du Bellay; and thenceforward all religious fervor and discipline were at an end. In the beginning of the reign of Louis XIV. only seven monks remained, whose licentious habits caused them to be called "the brigands of La Trappe." On July 18, 1664, De Rancé was consecrated abbot of La Trappe in the cathedral of Séz, by Oliver Plunket, archbishop of Armagh. The old monks who did not wish to adopt the severe life inaugurated by the abbot were allowed to depart, and were pensioned out of De Rancé's patrimony; and, after much opposition from the other Cistercian monasteries, and six years

of patient waiting, the mild firmness of the reformer and his exemplary life attracted a small number of followers. The chief centre of the reform, after La Trappe, was the Cistercian monastery of Tamié, near Faverges, in Upper Savoy. It adopted De Rancé's rule in 1677, was suppressed during the French revolution, and, after various vicissitudes, was again taken possession of, Oct. 15, 1861, by a colony of Trappists from Grâce-Dieu, near Besançon. The reform was approved by Innocent XI., but under certain restrictions. The monastic rule is noted for its severity. The members rise in the morning at 2 o'clock, and devote 12 hours a day to devotional exercises, and several hours to hard labor, mostly in the field. No worldly conversation is allowed; when meeting, they salute each other with the solemn *Memento mori* ("Remember death"). Their scanty food consists of water and vegetables; meat, wine, and beer are entirely forbidden. They sleep on a board, with a pillow of straw; and they never undress, not even in case of sickness. Hospitality is earnestly recommended; but it is also enjoined on the members to observe, in the exercise of hospitality, as much as possible the customary silence of the order and the simplicity of its mode of life. In 1789 the Trappists possessed, besides La Trappe and Tamié, only one monastery in Tuscany and one in western Germany. When they were suppressed in France, Dom Augustin Lestrange, who is regarded as the second founder of the order, opened an establishment at Fribourg in Switzerland, to which some of the monks repaired. The members of the other extinguished monasteries wandered through Europe for about 20 years, without finding a permanent abode. In 1817 the French government authorized the reopening of La Trappe, and the order soon counted several flourishing establishments. It was especially prosperous under the administration of the superior general Geramb (after 1825), one of the few Trappists who have won a reputation for authorship. In 1828, and again in 1830, the suppression of all the French establishments of the order was decreed by the government, but in neither case was the decree executed. Since 1870 the Trappists have ceased to exist legally in Italy and Switzerland, and in 1874 they were suppressed in the German empire. In 1803 a colony of Trappists led by Lestrange himself settled at Pigeon Hill, near Conewago, Pa.; in the autumn of 1805 they removed to Kentucky, thence to Florissant near St. Louis in 1808, and in 1809 to a farm 6 m. N. on the Illinois shore of the Mississippi. In 1813 they went to Tracadie in Nova Scotia, where they still exist. In 1848 Trappists from La Meilleraye in France settled at Gethsemane, Ky., 14 m. S. E. of Bardstown; a second establishment (now New Meilleray abbey) has since been founded in Iowa, 12 m. from Dubuque. Both of these have been raised to the rank of abbeys, the abbots wearing

the mitre.—An offshoot of the order of Trappists is the congregation of "Trappist Preachers," founded about 1845 by the abbé Muard, at Avallon, France, which connects home missionary labors with the observance of a Trappist mode of life.—The first convent of Trappist nuns was founded in 1692 in France.

**TRAS OS MONTES**, a N. E. province of Portugal, bordering on Spain and the provinces of Beira and Minho; area, 4,289 sq. m.; pop. in 1871, 865,838. It is the most mountainous part of the kingdom. The Douro constitutes its S. E. and S. boundary, and it is watered by its affluents the Sabor, Tua, and Tamega. It is now divided into the two districts of Villareal and Bragança. Capital, Bragança.

**TRASS.** See POZZUOLANA.

**TRAVANCORE**, a subsidiary native state of British India, occupying the S. W. extremity of the great Indian peninsula, terminating on the south in Cape Comorin, and bounded N. by the native state of Cochin and the district of Coimbatore in Madras, E. by the Madras districts of Madura and Tinneveli, and S. and W. by the Indian ocean; area, 6,658 sq. m.; pop. about 1,400,000. The capital is Trivandrum, on a small river in the S. part of the state, about a mile and a half from the sea; other important towns are Aleppi, Quilon, and Anjengo, all on the coast. The surface slopes seaward from the Western Ghats, which form its E. boundary, and at the N. E. corner reach an altitude of upward of 8,000 ft.; and the country is generally hilly, elevated, and well wooded, except on the coast. A large portion of the coast is low and sandy and fringed with cocoanut palms, but in the south the heights approach the sea and form a bolder shore. There is a good roadstead at Aleppi, and since 1871 Kolachul, near Cape Comorin, has been used as a port by the coffee planters, whose large ships have there found safe anchorage in still water. Travancore is drained by numerous westward-flowing streams, whose waters form extensive shallow lagoons or backwaters parallel with the coast. The largest river is the Periyar, in the north, about 140 m. long, which is known as the Alwe near the sea. The rainfall of the western half of the country exceeds 100 inches per annum, but it is not more than 52 inches among the mountains or at Cape Comorin. The climate is hot but not unhealthy; at the capital the temperature rarely exceeds 90° at any time, or 75° during the S. W. monsoon, when the most rain falls. The soil is nearly everywhere productive, and very rich in the lowlands, where excellent rice is raised. The most valuable crops are coffee, which is very successfully cultivated in the hills, cocoanuts, areca nuts, and pepper, all of which are largely exported; ginger, cinnamon, nutmegs, indigo, and cardamoms are also grown. The forests furnish timber for export in great abundance and variety. Cinchona plantations have been established under government auspices. The

fauna of Travancore corresponds closely with that of Malabar. The mineral resources are as yet undeveloped; but salt is made, and there are known to be deposits of iron. There are but few manufactures.—Travancore is a Hindoo principality, and Hindoos constitute the largest and most influential part of the population, but the aboriginal element has been largely won over to Christianity. This element is most prominently represented by the Shannar tribe, among whom three English missionary societies have labored for many years, until as many as 90,000 of them are Christians living in Tinneveli and Travancore. In North Travancore there are said to be 250,000 Roman Catholic converts, under one of the vicariates of southern India which originated in the Madura mission. There is a college of high standing at Trivandrum, affiliated with the Madras university, to which it sent 28 students in 1871. In 1872-'3 there were 16 other schools, at which English was taught to 808 pupils, 29 vernacular schools, and 138 village schools. The rajah maintains an astronomical observatory under the direction of a European astronomer. Many excellent roads and other public works have been constructed, and Travancore is one of the best governed and most prosperous native states in India. In 1872-'3 the total revenue of the government was £957,577, including £165,992 proceeds of the land tax and £130,421 from customs, while the total expenditure was but £549,865.—About the middle of the 18th century the many chieftains under whom Travancore was formerly parcelled out were subjugated by an ancestor of the present rajah, who ruled till 1799, and who adhered to the British in the war with Tippoo Sultan. In 1795 he entered into a subsidiary alliance with the Bombay government. The subsidy has been increased to £80,000 per annum, and the state is now supervised through the government of Madras. According to the fundamental Hindoo law of Travancore, the succession to the throne descends only through the female line. The sister of the present rajah, Rama Wurma, died in 1857, and as it was apparent that the line would otherwise become extinct, the British authorities guaranteed him the right of adoption.

**TRAVERSE**, a W. county of Minnesota, separated from Dakota by the Bois de Sioux or Sioux Wood river and Lake Traverse; area, about 575 sq. m.; pop. in 1870, 13. It is drained by Mustinka river and other affluents of Lake Traverse. The surface consists chiefly of rolling prairies. The St. Paul and Pacific railroad crosses the N. E. corner.

**TRAVIS**, a central county of Texas, intersected by the Colorado river; area, about 1,000 sq. m.; pop. in 1870, 18,153, of whom 4,647 were colored. The surface is moderately hilly, and the soil very fertile. There is considerable timber. Steamboats ascend the river to Austin, which is also the terminus of a branch of the Houston and Texas Central railroad.

The chief productions in 1870 were 498,710 bushels of Indian corn, 88,210 of sweet potatoes, 56,792 lbs. of butter, and 16,769 bales of cotton. There were 6,584 horses, 1,837 mules and asses, 8,952 milch cows, 8,991 working oxen, 30,765 other cattle, 12,013 sheep, and 25,854 swine; 6 manufactories of carriages, 8 of saddlery and harness, 1 of bricks, 2 breweries, and 2 saw mills. Capital, Austin, which is also the capital of the state.

**TREADWELL, Daniel**, an American inventor, born in Ipswich, Mass., in 1791, died in Cambridge, Feb. 27, 1872. While still young he invented a machine for making wood screws. In 1818 he produced a printing press of a new construction, and went to England in 1819. He there conceived the construction of a power press, which was completed the year after his return, and was widely used. In 1822, in connection with Dr. John Ware, he established and conducted the "Boston Journal of Philosophy and the Arts." In 1826 he devised the system of turnouts upon single-track railroads. In 1829 he completed the first successful machine for spinning hemp for cordage. Works capable of spinning 1,000 tons in a year were erected in Boston in 1831; and in 1836 he furnished to the Charlestown navy yard machines for spinning the hemp and cordage for the navy. His circular hackle or lapper has been generally adopted in spinning hemp for coarse cloth. In 1834 he became Rumford professor of technology in Harvard college, and held this post till 1845. He devised a method of making cannon of wrought iron and steel, and executed a contract with the government for 12 six-pounders. But his first plan being found too expensive, he improved and simplified it, and described his new method in a memoir before the American academy in 1835. He secured his invention by patent in the United States and in England, and published an account of it in 1856. It is certain that 18 years before the Armstrong gun was produced in England Treadwell had made his; and that some years after his English patent had been published Sir William Armstrong produced his gun, formed upon the same plan, and adding thereto rifling and breech loading.

**TREASON**, in general terms, any act of hostility against a state, committed by one who owes allegiance to it. There is one important difference in what may be called the form or manifestation of this crime, which seems to constitute a difference in its essence, and has led to some confusion of thought as to the crime itself, and as to the laws or proceedings for its prevention. This difference is between the crime as it may be committed against a monarch or against a republic. Where the power and majesty of a state are embodied in a personal sovereign, there treason against him is treason against the state; but where the state is not thus impersonated, the treason must be against the state itself, and cannot be committed against any person. The *crimen*

*læsa majestas*, in all the ages of republican Rome, was regarded as a crime against the state, and not against its magistrates, excepting as they represented the state. The simple word *majestas* was often used as meaning this offence, although the whole expression of it was: *crimen læsæ, imminutæ, diminutæ, or minutæ majestatis*. At a later period, when the emperors, having first accumulated in their persons the higher magistracies of the republic, gradually and yet rapidly became despotic and irresponsible while the language of the law remained almost unchanged for a considerable time, the crime itself came to be regarded as primarily a crime against the personal sovereign, and derivatively against the state. In Rome, as afterward in England, the power of the sovereigns to enlarge the scope of this crime, and accuse whom they would of it, was enormously abused. But in both of these states it always remained, and in all civilized countries it must always remain, the highest of crimes, and more deserving of the severest punishment than any other; and for these reasons it needs to be most carefully limited, and to be guarded not only as to its extent, but as to the proof by which it may be established. The constitution of the United States (art. iii., sec. 3) declares that "treason against the United States shall consist only in levying war against them, or in adhering to their enemies, giving them aid and comfort." This cannot be regarded as a definition of treason so much as a limitation of it, and a declaration of what portion of the offences which had been at different times included within its meaning should be regarded as so included by our law. The word treason is used as a customary law term of well known significance; and indeed, in the most important cases which have arisen in the United States, it would seem that this provision of the constitution has but exchanged the burden of defining treason for that of defining the levying war against a state and adhering to its enemies.—In order to show the true meaning of the word treason, we must go back to the Roman civil law, which on this point had an important influence on the English law. In the early days of Rome, the word *perduellio* (from *perduellus*, which is defined by Gaius as *hostis*) was used almost as a synonyme of *majestas*, and indicates the idea of hostility to the state as belonging to it. Although commonly spoken of as the equivalent of treason, *majestas* certainly had a wider extent of meaning and operation than treason ever had in its extremest abuse in England. Cicero says (using the word *majestas* here in its original sense): *Majestas est imperii atque in nominis populi Romani dignitate*. Elsewhere, for the purpose of defining the criminal offence of *læsa majestas*, he says: *Majestatem minuere est de dignitate, aut amplitudine, aut potestate populi, aut eorum quibus populus potestatem dedit aliquid derogare*; and in this wide sense *majestas* was applied to any malad-

ministration in office of any magistrate. It became afterward much more like treason as it was in the worst periods of English history; and the abuse of it may be illustrated by some of the provisions of imperial law about the statues of the emperors. By some of these it was declared that to repair their statues when going to decay, or to injure one accidentally and unintentionally, or even to sell one if it had not been consecrated, was not a crime against the majesty of the state; but to melt one down after it had been consecrated constituted this offence. The earliest punishment of the crime was perpetual interdiction from fire and water; the later, death, to persons of low condition by wild beasts or burning, to those of higher rank by the ordinary method of execution.—We find treason recognized and punished as a crime from the beginning of the common law; and always the cause of the crime was some act of hostility against the government by one who owed to it allegiance. But during many ages the criminal law of England was unwritten, and lay in the determinations of judges who were removable at the king's pleasure, and who were often so corrupt that public justice was perverted into an instrument of remorseless tyranny. In the reign of Edward IV. an unfortunate punster, who kept an inn in London with the sign of the crown, said he would make his son heir of the crown; and for this offence he was hanged, drawn, and quartered. In the same reign an owner of deer, one of which was killed by the king while hunting, said he wished the horns of the deer were in the king's stomach; and for this he was put to death. But at a later period, when Russell and Sidney were slain through the instrumentality of a judicial trial for treason, this atrocious wickedness assumes at least a more dignified appearance. Indeed, during the whole of English history until the times of Cromwell, treason always had, in a greater or less degree, the character of a political offence. At many periods the leading men of the age fell victims to it. Hence has arisen a feeling of compassion for the sufferers, and of doubt as to their guilt, which has had an important influence on the public estimation of the crime in that country, and to some extent in this. Another reason for some laxity of thought and feeling concerning this crime, is the extreme uncertainty of the earlier law as to its definition and limits. Thus, Glanvil expressly identifies it with the *crimen læsæ majestatis*; Bracton includes within it the counterfeiting not merely of the king's seal, but of the king's money; and by a very current phrase it was supposed to embrace all "encroaching of (encroachment upon) royal power." So early as the 25th year of Edward III. an attempt was made to remedy this uncertainty by a statute defining treason, which was for the time an excellent law, although quite too wide in its scope. Among the principal offences here called treason were compassing the death of

the king, queen, or prince, or levying war against the king, or adhering to the king's enemies; but all these offences were to be proved by some overt act. In some of the subsequent reigns this excellent provision was evaded by construction, or the statute was disregarded, or new ones made. Thus, by the 32d of Henry VIII. it was made high treason to accept, take, judge, or believe the king's marriage with Anne of Cleves as legal and valid. But the leading provisions of the statute of Edward III. are still the law of England, and the reasonable construction of its language by the courts of England has been generally followed by the courts of the United States in construing the provisions of our own constitutions and laws. By the 1st of Edward VI. the provision was introduced which we have copied, requiring, for the conviction of one charged with treason, two sufficient and lawful witnesses; but this provision was in many instances shamefully perverted. Thus when only one living witness could be found who would testify to Algernon Sidney's treason, Jeffreys decided that garbled extracts from his writings might be read as the other witness, and on this testimony he was convicted and executed; and no greater dishonor rests on the name of Bacon than that he assisted his master, King James, in corrupting the judges of the king's bench into a willingness to convict of treason one Peacham, a parish priest, on the evidence of a sermon which he had never delivered, and which was found by searching his study. Out of the many civil conflicts and commotions in England, and especially the wars of the roses, grew one rule, still in force, and resting on the soundest justice and reason. During those ages of constant disturbance, when there were frequently more persons than one who claimed the crown, and, so far as they could, exercised royal authority, almost every person incurred the danger of treason, in case the claimant to whom he adhered was defeated; and for this cause, or on this pretence, multitudes of men of every rank perished on the scaffold. But from the obvious absurdity of exacting from every individual a sound, or rather a fortunate judgment as to the obscure and complicated grounds on which the claim to sovereignty often rested, it became and still remains a well settled rule, that no one incurs the guilt of treason by adherence to a king or government *de facto*, although that king or government has but the right of a successful rebel, and loses it all by a subsequent defeat.—In considering the crime of treason in the United States, we must remember that there may be treason against the United States, and also treason against any one of the states. Looking first to treason against the United States, the foundation of the law itself, and of our knowledge of it, must be the clause in the constitution already quoted; and as there is no common law of the United States, this clause would have remained inoperative but for the act of congress of 1790,

chap. 36, sec. 1, whereby it was enacted, "that if any person or persons owing allegiance to the United States of America shall levy war against them, or shall adhere to their enemies, giving them aid and comfort within the United States or elsewhere, and shall be thereof convicted, on confession in open court, or on the testimony of two witnesses to the same overt act of the treason whereof he or they shall stand indicted, such person or persons shall stand adjudged guilty of treason against the United States, and shall suffer death." When the courts came to the construction and application of that act, they very properly made use of the principles and the jurisprudence of the common law; and they could do this the better, because the clause of the constitution is substantially the same as a provision of the statute of Edward III., and the best ability of England had been carefully employed about that statute. For a judicial exposition of that clause and that statute, we must look to the trial of Burr, and of Bollman and Swartwout (4 Cranch, pp. 75 to 137), although these are not the only cases in which the same subject has been considered.—The first question is: What is a levying of war against the United States, within the meaning of the statute? In the first place, the levying of war must be actual; it must be carried out into some practical operation and effect. No intention, and no extent or thoroughness of preparation or of conspiracy for war, constitutes the crime of treason until the war actually begins. Some kind of force or violence, it is said, must be used. But it would seem that this force may be what the law would call constructive force; and it may be very slight; for it certainly need not be sufficient to accomplish either the general purpose of the war, or the particular effect proposed. But, if there be any overt act of war, then every one aiding and abetting this act of war, however remotely, does himself levy war and commit treason. It must be difficult to determine always what this rule requires. Thus, Marshall declares that if an army be actually raised for the avowed purpose of carrying on war against the United States, and subverting their government, the point must be weighed very deliberately before a judge would venture to decide that an overt act of levying war had not been committed by a commissary or purchaser who never saw the army, but who, knowing its object and leaguering himself with the rebels, supplied that army with provisions; or by a recruiting officer, holding a commission in the rebel service, who, though never in camp, executed a particular duty required of him. Hence it would follow, that if there be an act of levying war against the United States, persons may be participators of that act, and of the crime which it constitutes, although they reside as far as possible from its actual locality. The prevailing rule of the criminal law, that there may be principals and accessories to a

crime, has no application whatever to treason. We are warranted by the language of Chief Justice Marshall in saying, that if a rebellion were so extensive as to spread through every state in the Union, every individual concerned in it is not legally present at every overt act committed in that rebellion; nor can it be said that even the commander-in-chief of the rebel army, or the head of the organized rebellion, is legally present at every such overt act. But while a man may be actually absent, yet if he have counselled or procured the treasonable act, he is a principal traitor, not because he is legally present, but because in treason all are principals. This question of locality has yet another importance. A person charged with this crime can be tried only within the state or judicial district in which it is committed, and the alleged criminal has indeed a strict right to be tried by a jury within that state or district. A wide extent may be given to this rule, by the doctrine that in treason all are principals, as above stated; but it can apply only to those persons who would, in the locality in which they reside, be either principals or accessories if there could be accessories to this crime. For if a person commits his own act of treason in a certain locality, and is not connected with any one committed elsewhere, so as to be, in this way, a principal in the act, he can be tried only within his locality; and if the judicial tribunals of the United States cannot or will not perform their proper functions within that state or judicial district, he cannot be tried anywhere. It is certain, too, that the overt act which is alleged to be a treasonable act, must have been done with "a treasonable purpose." We have on this point high authority for saying, that if the object of the act be to prevent by force the execution of any public law of the United States, that is a treasonable purpose, for it aims at overthrowing the government as to one of its laws. So, if the purpose be to overthrow the government at one place, large or small, that is a treasonable purpose.—What, then, is adhering to an enemy, or, in the language of the constitution, giving him aid and comfort? It is perhaps impossible so to define these words as to make their meaning any plainer. But, again on high authority, this meaning may be illustrated thus: If a conspiracy to levy war against the United States be in actual operation anywhere within it, any citizen, residing anywhere else and at whatever distance, if he supply the rebels with arms or any munitions of war, with provisions to be used in support of the war or of the rebels while carrying it on, or money, or intelligence or information, and even if none of these things reach the rebels, he becomes a traitor in the place where he resides. So it would come under this branch of treason, if forts, castles, or ships of war were delivered to the enemy, or if the accused had joined the enemy's forces, though no battles or conflicts take place. The same principles would un-

doubtedly apply, whether the treason charged were committed against the United States or against any one of the states, qualified only by any special provisions of the constitution or law of that state.—As all treason consists of hostility against a state by one who owes it allegiance, so only one who owes this duty, in some way, may be a traitor. But it is held that this modified allegiance may be that of an alien residing in this country and enjoying the protection and advantages of its government. The allegiance of an alien, however, or the possibility of his becoming a traitor, ends with his residence in this country; while the duty of allegiance goes with a citizen wherever he goes; and wherever he may be, he becomes a traitor by hostility against the government in violation of this duty.—We have seen that no one can be convicted of treason except on the evidence of two witnesses; but with this exception, the trial for treason is conducted in all respects like any other criminal trial for a capital offence. If convicted, the traitor may be sentenced to death by the ordinary means of execution; but by act of congress of July 17, 1862, the punishment in the discretion of the court may be imprisonment for not less than five years and a fine of not less than \$10,000. We have no remnant of that ferocious cruelty which was considered necessary in barbarous ages, and in statutes often outlived them. Until the 80th year of George III. the convict of treason forfeited his property to the crown, was drawn on a hurdle to the gallows, there hanged, then cut down, disembowelled, and his entrails burned before life was extinct; and the body was then beheaded and quartered.

**TREASURE TROVE** (literally, found treasure), a term applied to money, coin, plate, or other forms of the precious metals, found hidden, for which no owner or depositor can be discovered. By the common law of England such property becomes vested in the sovereign, if it appears to have been concealed with the intention of reclaiming it. In all other cases, as where circumstances show that the treasure was intended to be abandoned, it belongs to the finder, who by a special order in council is also entitled to the commercial value of ancient coins and other objects of antiquarian interest, under whatever circumstances they may be found. The civil law formerly gave the treasure trove to the finder; or if found on another man's land, it was divided between them; but the practice in continental Europe has in modern times been similar to that in England.

**TREBBIA** (anc. *Trebia*), a small river of N. Italy, rising in the Ligurian Alps, about 15 m. N. E. of Genoa, and emptying into the Po 3 m. above Piacenza. On its banks the Romans under T. Sempronius were defeated by Hannibal in 218 B. C., and the French under MacDonald by Suvaroff, June 17-19, 1799.

**TREBIGNÉ**, or *Trebigne*, a town and formerly the capital of Herzegovina, European Turkey,

about 8 m. from the frontier of Montenegro, and 15 m. N. E. of Ragusa; pop. less than 5,000. A Roman Catholic bishop resides here, and there are several churches and mosques. It is defended by a square fort with four towers. Trebigne and its vicinity were the theatre of war with the Turks during the insurrection of 1875-'6. Under the early kings of Servia it was of much greater importance.

**TREBIZOND.** I. A vilayet of Asiatic Turkey, extending, in a generally narrow strip from 20 to 80 m. wide, about 360 m. along the S. coast of the Black sea, between lon.  $35^{\circ} 40'$  and  $42^{\circ}$  E., bounded N. E. by the Russian division of Transcaucasia, E. by Erzerum, S. by Erzerum and Sivas, and W. by Kastamuni; area, about 15,000 sq. m.; pop. estimated at 940,000. The scenery on the coast is remarkably beautiful. The mountains rise immediately from the sea to the height of from 6,000 to 8,000 ft. in the east (in single peaks much

higher), and nearly 5,000 ft. in the west, and are clothed with every variety of vegetation, from grass to dense forests. The country is generally well wooded and mountainous, and has but little arable land. The principal rivers are the Tchoruk, which enters the sea near the E. frontier, and the Yeshil Irmak and Kizil Irmak, the lower courses of which drain the W. part of the province. The climate is temperate but variable, being subject to cold winds from the Black sea, bearing rain and fog. The province is decidedly healthful. There are numerous fertile valleys and well cultivated tracts, but the country does not produce sufficient grain for home consumption. The inhabitants are described as bold and hardy. In many districts they are isolated cottagers, there being few villages. There are 56,000 Christians in the province, of whom two thirds belong to the Greek church, and the rest are Armenians. The chief towns, besides the

Trebizond.

capital, are Tireboli (anc. *Tripolis*), Keresun (*Cerasus*), Rizah (*Rhizus*), Batum (*Bathys*), and Samsun. The vilayet embraces the main parts of ancient Pontus, extending both E. and W. beyond its limits. II. A city (anc. *Trapezus*), capital of the vilayet, sometimes called Tarabazan, on the S. E. shore of the Black sea, in lat.  $41^{\circ} 1' N.$ , lon.  $39^{\circ} 45' E.$ , 560 m. due E. of Constantinople; pop. about 40,000. It is the first Turkish commercial port on the Black sea, and the entrepot of an extensive trade with the interior provinces and Persia. A peninsula separates the harbor into two ports, of which the eastern affords shelter and anchorage for the largest vessels. There is a lighthouse here and another at Platana, a roadstead about 6 m. W. of Trebizond. Four steamship lines connect the city with the principal ports of Turkey and southern Russia. Grain, from Russia and the Danube, is the chief article of import; the exports produced in the province itself include flax, nuts, butter, beans, linseed, fruits, tobacco, rice, wine, olive oil, fish oil, beeswax, and timber. The

overland trade with Persia is valued at more than \$6,500,000 per annum, and gives employment to 60,000 pack horses, 6,000 asses, 2,000 camels, and 8,000 oxen. Tobacco, silk, raisins, and carpets are exported from Persia for shipment at Trebizond, whence are imported cotton and woollen goods, tea, sugar, glass ware, hardware, and European manufactured goods of many kinds. The inland traffic with Anatolia, on the west, represents a value of more than \$2,500,000; the exports through Trebizond comprising grain, potatoes, fruits, skins, wax, honey, and chestnuts. The city consists of an old and a new town, the former surrounded by walls and towers enclosing the citadel, which stands upon the flat top of a steep rock. The modern town is mainly without these walls on the E. side. Trebizond is well paved and drained, but the houses generally are neither commodious nor comfortable. There are 40 mosques, 18 Mohammedan schools, and 16 churches, of which 9 are Greek, 4 Armenian, 1 Catholic Armenian, 1 Latin, and 1 Presbyterian.—Trapezus was

founded by a colony from Sinope, and was a flourishing town when Xenophon arrived there on his retreat from Cunaxa. It became subject to the Romans by conquest from Mithridates. The emperor Trajan constructed a mole to improve the port, and made it the capital of eastern or Cappadocian Pontus. During the reign of Gallienus it was plundered and nearly destroyed by the Goths, but in the time of Justinian it had completely recovered, and was made the capital of a province which included Pontus and some part of Armenia. In 1204 it became the seat of an independent branch of the Comnenus family (see ALEXIS, and BYZANTINE EMPIRE), under whom the territory was called the empire of Trebizond. It continued subject to this line of rulers until it was conquered by the Turks in 1461.

**TREDGOLD, Thomas**, an English engineer, born at Brandon, near Durham, Aug. 22, 1788, died in London, Jan. 28, 1829. In 1808 he went to Scotland, where he worked five years as a journeyman carpenter and joiner, studying ardently in spare hours. In 1813 he went to London, and entered the service of William Atkinson, architect to the ordnance, and in 1823 commenced as civil engineer on his own account. He published "Elementary Principles of Carpentry" (4to, London, 1820); "A Practical Essay on the Strength of Cast Iron and other Metals" (8vo, 1821); "The Principles of Warming and Ventilating Public Buildings, Dwelling Houses," &c. (2d. ed., 1824); "A Practical Treatise on Railroads and Carriages" (1825); "Remarks on Steam Navigation, and its Protection, Regulation, and Encouragement" (1825); and "The Steam Engine, comprising an Account of its Invention and progressive Improvement, with an Investigation of its Principles" (4to, 1827), a later edition of which (1850-'53) is in 4 vols. 4to, with 226 steel plates and 164 woodcuts.

**TREE FROG**, the name of the batrachian reptiles of the family *hylada*, distinguished from common frogs (*ranida*) by having the ends of the fingers and toes dilated into flattened disks or suckers, which enable them to lead an arboreal life. They are more elegant, smaller, brighter, and more active than the *ranida*, and are lively during the day; they feed on insects; they climb like the geckos among lizards, and by the same mechanism; the lower surface of the disks is endued with a viscid secretion, by means of which they can walk with the body suspended from the under parts of leaves and other smooth bodies; the skin is mostly smooth upon the back, but on the abdomen and inside of legs thickly studded with small warts or tubercles. They possess to a remarkable degree the faculty of changing color, which enables them to elude their numerous enemies. They are very clamorous, and particularly noisy at the approach of rain; in winter they bury themselves in the mud at the bottom of pools; they breed in the spring, depositing their eggs in the water. They are

frequently called tree toads, and their French name is *rainettes*. The species are numerous, especially in America; only one is found in Europe, and that also occurs in N. Africa and Asia.—The common tree frog of North America (*hyla versicolor*, Le Conte) resembles a toad in form, but is more flattened; body short and warty above, the color varying from pale ash to dark brown, with several large irregular blotches of greenish brown, white and granulated below, and abdomen yellowish near the thighs; the colors vary at the will of the animal. The head is short and rounded, the mouth large, with teeth on upper jaw and vomer; eyes large and brilliant, the iris bright golden; there are four fingers and five toes, both ending in viscid pellets, the former distinct, but the latter webbed for four fifths of their length. It is about 2 in. long, and is found abundantly in the northern and middle states, and as far west as the Mississippi; it is generally seen on

Common Tree Frog (*Hyla versicolor*).

decaying trees and about old fences of wood or stone, overgrown with mosses and lichens, the color of which it so nearly resembles that it is very difficult to detect; it is very noisy in spring and summer toward evening, especially in cloudy weather; the secretion of the skin is copious and very acrid. This species is replaced in the southern states by the green tree frog (*H. viridis*, Laur.; *calamita Carolinensis*, Penn.), which is bright green above, yellowish white below, with a straw-colored lateral line extending from the upper jaw over the shoulder and along the side. The tree frog of Europe (*H. arborea*, Linn.) much resembles the green species of North America, and the latter was considered by Laurenti a variety of his *H. viridis*; it is spread throughout Europe, except in Great Britain.—In the genus *acris* (Dum. and Bibr.) the locomotive disks are less developed and the limbs more slender than in *hyla*, and there are teeth on the palate instead of the

vomer. The *A. gryllus* (Dum. and Bibr.), or Savannah cricket, occurring from New England to the gulf of Mexico, is about 1½ in. long, with an elongated pointed head, a triangular dusky spot between the orbits; body ashy above, with a green and sometimes reddish dorsal line, and three oblong black spots margined with white on the sides. It may easily be domesticated; it makes immense leaps; it is intermediate between the *ranida* and *hylada*, having the aquatic habits of the former and the method of watching for its prey of the latter; in consequence of the smallness of the disks it cannot adhere to the under surface of smooth bodies.—The flying tree frog of Borneo (*rhacophorus*), according to Mr. Wallace, has its very long toes fully webbed to their extremity, so that by expanding these webs and inflating its body, it is able to use them as a parachute or sailing membrane in its descent

Flying Tree Frog of Borneo (*Rhacophorus*).

from high trees. The frog is 4 in. long, deep green above, yellow below; the webs of all the feet cover a surface of 12 sq. in.; at the ends of the toes are the usual disks for adhesion. This is the only aerial batrachian known.

**TREE SORREL**, or properly **Sorrel Tree**, a North American tree of the heath family (*ericaceæ*), formerly known as *Andromeda arborea*; when later botanists subdivided Linnaeus's genus *Andromeda*, this was placed by itself in a new genus, *oxydendrum* (Gr. *ὀξύς*, sour, and *δένδρον*, a tree), a name which recognizes the marked acid character of the foliage; it is also known as sour-wood. The only species, *O. arboreum*, is found from Ohio and Pennsylvania southward, especially along the mountains, where it is met with as a large shrub, or in favorable locations it forms a tree 40 or even 60 ft. high. Its leaves are deciduous, serrulate on the margins, with slender petioles, and being pointed at each end they have much the appearance of those of the peach. The flowers, which appear in June and July, and even later, are in long one-sided racemes which are clustered at the ends of the branches; the corolla is ovate with five teeth, white, and in size and arrangement upon the stem bear some resemblance to

those of the lily of the valley; after the flowers fall the small pyramidal pods remain white for a long time, and at a little distance appear like

Sorrel Tree (*Oxydendrum arboreum*).

flowers. The wood of the tree is of little value; the leaves are pleasantly sour, and are chewed by hunters to allay thirst. The tree is hardy north of its natural localities, and endures the climate of Boston. As an ornamental tree it possesses many merits, not the least of which is that of flowering when only a few feet high; when it is 10 or 15 ft. high it forms a spreading head, to which its fine spray gives a very light appearance, and when covered with its abundant clusters of delicate white flowers, it is a truly beautiful object; in autumn the foliage takes on a pleasing dark crimson color.

**TREFOIL.** See CLOVER.

**TREGELLES, Samuel Prideaux**, an English scholar, born in Falmouth, Jan. 30, 1813, died in Plymouth, April 24, 1875. His parents were Quakers, but he himself became connected with the Plymouth Brethren. He was educated at Falmouth grammar school, was employed in the iron works at Neath Abbey, Glamorganshire, and in 1836 became private tutor in Falmouth. He devoted himself to the study of the Scriptures in the originals and the old versions, especially the Syriac, and edited "The Englishman's Greek Concordance to the New Testament" (8vo, 1839); "The English Hexapla," with a historical account of the English versions of the Scriptures (1841); "The Englishman's Hebrew and Chaldee Concordance to the Old Testament" (2 vols., 1843); and "Hebrew Student's Manual," comprising Hebrew reading lessons, and the book of Psalms with interlinear translations (1845); and he translated, with additions and corrections, Gesenius's "Hebrew and Chaldee Lexicon to the Old Testament" (4to, 1847). Dr. Tregelles visited the continent several times for the purpose of collating the principal un-

cial manuscripts of the Scriptures in the libraries. At Rome he was allowed to see the Vatican manuscript, but was not permitted to collate it. His greatest work is "The Greek New Testament, edited from ancient Authorities, with the Various Readings of all the ancient Manuscripts, ancient Versions, and earlier Ecclesiastical Writers, together with the Latin Version of Jerome" (6 parts, 1857-'72). His other publications are: "The Book of Revelation, translated from the ancient Greek Text" (1848); "The Jansenists, their Rise, Persecution by the Jesuits, Existing Remnant," &c. (1851); "Defence of the Authenticity of the Book of Daniel" (1852); "Account of the Printed Text of the Greek Testament" (1854); *Codex Zacynthius*, a Greek palimpsest, containing portions of St. Luke's Gospel (1861); and *Canon Muratorianus*, the earliest catalogue of the books of the New Testament (4to, 1868). He contributed to Smith's "Dictionary of the Bible." He received the degree of LL. D. from St. Andrews university in 1850.

**TREGO**, a W. county of Kansas, intersected by the Saline and Smoky Hill rivers; area, 900 sq. m.; pop. in 1870, 166. It is traversed by the Kansas Pacific railroad. The surface is rolling and the soil rich. It is unorganized.

**TREMPEALEAU**, a W. county of Wisconsin, bounded S. W. by the Mississippi river, intersected by Trempealeau Mountain river, and drained also by Black and Buffalo rivers; area, 684 sq. m.; pop. in 1875, 14,992. The surface is level and the soil fertile. The chief productions in 1870 were 516,194 bushels of wheat, 141,275 of Indian corn, 241,408 of oats, 17,558 of barley, 47,699 of potatoes, 37,242 lbs. of wool, 341,043 of butter, and 18,794 tons of hay. There were 2,784 horses, 3,587 milch cows, 5,328 other cattle, 9,536 sheep, and 2,906 swine. Capital, Galesville.

**TRENCH, Richard Chenevix**, a British clergyman, born in Dublin, Sept. 9, 1807. He graduated at Cambridge in 1829, and after spending some years in travel took orders in 1838, and became curate to Hugh James Rose at Hadleigh, Suffolk, and in 1835 incumbent of Ourdridge, a chapelry in the parish of Bishop's Waltham, Hants. In 1840 he was appointed curate to Archdeacon Wilberforce at Alverstoke, near Gosport, and in 1844 rector of Itchenstoke. Dr. Wilberforce, being made bishop of Oxford in 1845, appointed Mr. Trench his examining chaplain. During this and the following year he was Hulsean lecturer at Cambridge. From 1846 to 1858 he was theological professor in King's college, London. In 1856 he was made dean of Westminster, and on Jan. 1, 1864, he succeeded Dr. Whately as archbishop of Dublin. He has published the following poetical works: "Justin Martyr, and other Poems" (London, 1835; 5th ed., 1862); "Sabbation, Honor Neale, and other Poems" (1838); "Poems from Eastern Sources," and "Genoveva" (1842; 2d ed., 1851); "Elegiac Poems" (1846); and "Alma"

(1854). His theological publications include "Notes on the Parables" (1841; 11th ed., revised, 1870); "The Sermon on the Mount, illustrated from St. Augustine" (London, 1844; 8d ed., 1869); two volumes of Hulsean lectures, "The Fitness of Holy Scripture for unfolding the Scriptural Life of Men" (Cambridge, 1845), and "Christ the Desire of all Nations" (1846); "Notes on the Miracles" (1846; 9th ed., 1870); "Sacred Latin Poetry" (1849; new ed., 1864); "The Star of the Wise Men" (1850); "Sermons preached in Westminster Abbey" (1860); "Commentary on the Epistles to the Seven Churches in Asia" (1861; 8d ed., 1866); "Studies on the Gospels" (1867); "Shipwrecks of Faith," three sermons (1867); and "Sermons preached for the most part in Ireland" (1878). Among his philological works are: "The Study of Words" (1851; 15th ed., 1874); "The Lessons in Proverbs" (1853; 6th ed., 1869); "Synonymes of the New Testament" (1854; 2d series, 1863; 7th ed., enlarged, 1871); "English, Past and Present" (1855; 8th ed., 1870); "On some Deficiencies in our English Dictionaries" (1857); "On the Authorized Version of the New Testament" (1858); and "A select Glossary of English Words used formerly in Senses different from their present" (1859; 4th ed., 1865). He has also published "Calderon, his Life and Genius, with Specimens of his Plays" (8vo, 1856; 2d ed., 1865); "Gustavus Adolphus, with other Lectures on the Thirty Years' War" (1865; 2d ed., 1866); and "Plutarch, his Life, his Parallel Lives, and his Morals" (2d ed., 1874); and he has edited "The Remains of the late Mrs. Richard Trench," his mother (1862), and a "Household Book of English Poetry" (1868).

**TRENCK. L. Franz von** &c., baron, an Austrian soldier, born in Reggio, Calabria, Jan. 1, 1711, died in prison at Brunn, Oct. 14, 1749. In his 17th year he entered the Austrian service, but was obliged to leave it on account of his insubordination and excesses. In 1738 he became captain in a Russian hussar regiment. He was twice condemned to death for violations of discipline, but was saved by Marshal Münnich, and after six months' penal labor retired to his estates in Slavonia. In 1740 he was permitted by the empress Maria Theresa to raise a corps of pandours at his own expense, which soon numbered 5,000 men. At the head of these he served in the war of the Austrian succession, and distinguished himself by his courage, cruelty, and rapacity. Having at length, while undergoing trial by court martial, throttled one of the judges and attempted to throw him out of a high window, he was condemned to perpetual imprisonment in the castle of Spielberg at Brunn, where, according to some, he poisoned himself. He possessed astonishing physical strength, united with a disposition of extraordinary ferocity. His autobiography appeared at Vienna in 1807, under the title of *Merkwürdiges Leben und Thaten des Freiherrn Franz von der Trenck*;

and his life has been written by Hübner, under the title of *Frans von der Trenok, dargestellt von einem Unparteiischen, mit einer Vorrede von Schubart* (8 vols., Stuttgart, 1788).

**II. Friedrich von der**, a German adventurer, cousin of the preceding, born in Königsberg, Feb. 16, 1726, guillotined in Paris, July 25, 1794. He was admitted in 1742 into the body guard of Frederick the Great, and when only 18 years old was selected to instruct the Silesian cavalry. In the campaign of 1744 he served with distinction, acting as the adjutant of Frederick, with whom he became a favorite. In his memoirs he says he offended the king by an amour with the princess Amelia, but the story is apparently without foundation. In 1745 he again distinguished himself; but having corresponded with his cousin Baron Franz, then in the Austrian service, he was arrested and imprisoned in the fortress of Glatz for more than a year. After several desperate efforts he escaped and went to Vienna, where he got into much trouble and fought several duels. After the peace he was received with much favor at Moscow. His cousin left him his estate, on condition that he should become a Catholic and should serve only the house of Austria. To secure this he went to Vienna in 1750, but after three years of waiting he received only 68,000 florins. By the Austrian court he was made captain of cavalry. In March, 1754, he made a journey to Dantzic to settle some family affairs, and was there apprehended by the Prussian authorities, carried to Berlin and thence to Magdeburg, where he was confined in a dungeon in the citadel. He made several desperate efforts to escape, but failed in all of them, and after ten years' imprisonment, during which he was more and more heavily loaded with irons, he was finally released by order of Frederick in December, 1763, and carried to Prague. Disappointed of preferment at the Austrian court, he retired to Aix-la-Chapelle, married there in 1765, and lived for several years in peace, occupying himself with literary pursuits. In 1767 appeared his poem *Der macedonische Held*, which gave him considerable reputation in Germany. He also engaged in the wine trade. From 1774 to 1777 his time was spent chiefly in travelling through England and France. Subsequently he retired to his estate at Zwerbach, spent several years in agricultural pursuits, and published a collection of his works and a history of his life. After the death of Frederick in 1786 the confiscation of his estates was annulled, and he was permitted to return to his native country. During the French revolution he went to Paris, where he was arrested by the committee of public safety and put to death on the charge of being a secret emissary of the king of Prussia. His autobiography is very interesting, and has still considerable circulation, though it is certain that Trenck was a braggart and a liar, and has immensely exaggerated his adventures.

**TRENDELENBURG, Friedrich Adolf**, a German philosopher, born at Eutin, near Lübeck, Nov. 30, 1802, died in Berlin, Jan. 24, 1872. In 1826 he graduated in Berlin, where he was private tutor till 1833, and subsequently professor at the university, of which he was three times rector. He was also for over 20 years secretary to the historico-philosophical section of the Berlin academy. He was a follower of Aristotle and an opponent of Hegel. His works include *Elementa Logices Aristotelicae* (Berlin, 1837; 6th ed., 1868); *Logische Untersuchungen* (1840; 3d ed., 1870); *Geschichte der Kategorienlehre* (1846); *Historische Beiträge zur Philosophie* (2d and 3d vols., 1856-'67); *Naturrecht auf dem Grunde der Ethik* (1860; 2d ed., 1868); *Lücken im Völkerrecht* (1870); *Kuno Fischer und sein Kant* (1869), which led to Fischer's *Anti-Trendelenburg* (1870); and *Kleine Schriften* (2 vols., 1871).—See Bonitz, *Zur Erinnerung an Friedrich Adolf Trendelenburg* (Berlin, 1872).

**TRENT**, a river of England, which rises in Staffordshire, 4 m. N. of Burslem, flows through the central part of the country, and near Burton-on-Strather, Lincolnshire, joins the Ouse to form the estuary called the Humber. Its course is first S. E., then N. E., and finally N. Its total length is about 150 m., of which 25 m., as far as Gainsborough, is navigable for vessels of 200 tons, and 117 m., reaching to Burton-on-Trent, for barges of 25 tons. Its chief tributaries on the right are the Sow, Tame, Soar, and Devon, and on the left the Blyth, Dove, and Derwent; and it is connected with other navigable waters by canals. Stoke and Nottingham are situated on its banks.

**TRENT** (Ital. *Trento*; Ger. *Trient*; anc. *Tridentum*), a city of Tyrol, Austria, on the left bank of the Adige, 88 m. S. by W. of Innsbruck; pop. in 1870, 17,078. It is in a beautiful valley, surrounded on the east by mountains, and is Italian in its architecture. It has a cathedral built entirely of marble in the Byzantine style. In the church of Sta. Maria Maggiore, of red marble, are the portraits of the members of the council of Trent, which was held in that building. The extensive castle is generally the residence of the local prince-bishop. Silk is the principal manufacture; wine is largely produced; and there is an active transit trade.—The ancient *Tridentum* was a town of the Rhetians, and subsequently became a Roman colony. Under the old German empire it was a free imperial city, ruled by prince-bishops. In 1802 it passed under the domination of Austria.

**TRENT, Council of** (*concilium Tridentinum*), the 19th œcumenical council, according to the Roman Catholic church. The first occasion for an œcumenical council in the 16th century was furnished by Luther, who on Nov. 28, 1518, appealed from the bull of Leo X. to a general council, and was supported by the Protestant princes. The Catholic sovereigns also desired that a council should be convened.

Three popes, Leo X., Adrian VI., and Clement VII., died before the demands of the Germans were complied with. At length Paul III., after failing in attempts (1536-'8) to convene a council at Mantua, and next at Vicenza, convoked it for Nov. 1, 1542, to assemble at Trent; but on account of the war between the emperor Charles V. and Francis I. of France he again put off the day of opening to March 15, 1545, and the actual opening did not take place until Dec. 13, 1545. The objects of the council were to effect a reformation of the church, to define more explicitly the impugned doctrines of the church, and, if possible, to induce the Protestants to return to the old faith. At the second session (Jan. 7, 1546) the council fixed the mode of transacting business. The discussions and deliberations were to take place in private congregations; subsequently general congregations were to draft the resolutions, which finally were to be promulgated in public sessions as decrees. In the third session (Feb. 4) the Nicene creed was read and declared to be the basis of the further proceedings. In the fourth session (April 8) tradition was declared to be equally with the Bible a rule of faith; the Apocrypha of the Old Testament were included in the Biblical canon; the Vulgate was proclaimed to be the authentic version of the Bible, and the church its only legitimate interpreter. In the three following sessions (June 17, 1546; Jan. 13 and March 3, 1547), the Catholic doctrines of original sin, justification, and the sacraments were defined, and an anathema pronounced upon all who rejected these doctrines. In the eighth session (March 11), 88 of the 56 bishops present, together with the papal legate, determined, on the ground of being exposed at Trent to the plague, to adjourn to Bologna, notwithstanding the decided opposition of the emperor, at whose request 18 German and Spanish bishops remained at Trent. At Bologna, where 6 archbishops, 82 bishops, and 4 generals of religious orders were present, the 9th and 10th sessions were held (April 21 and June 2); but, at the express order of the pope, who had some apprehensions of a schism, no decrees were promulgated, except decrees of prorogation. As Charles V. could not be prevailed upon to recognize the council of Bologna, the council was indefinitely prorogued by a bull of Pope Paul III., dated Sept. 17, 1549. The pope died in November, 1549, and on May 1, 1551, the council was reopened at Trent by order of Julius III. France protested against the continuation, and all the French bishops and theologians withdrew. In the succeeding transactions the Jesuits Laynez and Salmeron, who were sent to the council as papal theologians, took a leading part. There appeared also representatives from the Protestant princes of Wurtemberg and Brandenburg, and even Melancthon was summoned there by order of the elector Maurice of Saxony; but it was found impossible to effect a

reunion, and soon the outbreak of a new war of the Protestant princes against the emperor caused the assembled fathers (April 28, 1552) to suspend their deliberations. During this period, extending from the 11th to the 16th session, the doctrines of the eucharist, confession, and extreme unction, and two reformatory decrees on the jurisdiction of the bishops, were promulgated. Paul IV. was anxious to assemble the council at Rome, but Pius IV. consented to its reopening at Trent, which took place on Jan. 18, 1562, through the cardinal legate Prince Ercole Gonzaga of Mantua. The representatives of Charles IX. of France and the emperor Ferdinand I. wished to conciliate the Protestants by granting the cup to the laity, and the duke of Bavaria demanded the abolition of celibacy. The former question was referred to the pope; the latter was unanimously rejected. On Nov. 13 the cardinal of Lorraine arrived, with 14 bishops, 8 abbots, and 18 theologians from France, and presented in the name of his nation 84 reformatory articles, but subsequently abandoned their advocacy. On the question whether episcopal jurisdiction proceeds immediately from Christ, or mediately only and through the pope, no decree was arrived at; it being simply declared that "bishops are established by the Holy Ghost, to rule the church of God." Decrees were adopted ordering an index of prohibited books to be made, and defining the doctrines of the mass, ordination, the hierarchy, marriage, celibacy, purgatory, the veneration of saints, relics, and images, monastic vows, indulgences, and fasting and abstinence. Several "reformatory" decrees were also passed, the most important of which enjoined the establishment of theological seminaries. The close of the council was hastened by a serious sickness of the pope, and his fear that his death might lead to a schism. It took place on Dec. 4, 1563, at its 25th public session. The decrees were signed by 255 members, consisting of 4 legates, 2 other cardinals, 8 patriarchs, 25 archbishops, 168 bishops, 39 representatives of absent bishops, 7 abbots, and 7 generals of religious orders. An authentic copy was also signed by the ambassadors of the secular governments, with the exception of the ambassador of Spain, who was without instruction, and the ambassador of France, who was absent. The decrees were confirmed by the pope, with the unanimous consent of the cardinals, in the consistory of Jan. 26, 1564; but the pope reserved to himself the right of explaining obscure or controverted points. The council was accepted unconditionally by most of the Italian states, by Portugal, Poland, and the German emperor; with a reservation of the royal prerogatives by Spain, Naples, and the Netherlands; with some exceptions by Switzerland and Hungary; and only so far as respects doctrines by France.—The "Canons and Decrees" of the council were printed by Aldus Manutius (Rome, 1564). The "Catechism," an authorized summary of the faith drawn up

by order of the council, appeared at Rome in 1566, and the collection of documents relating to its history was edited by Le Plat (7 vols. 4to, Louvain, 1781). The first complete history of the council was written by Paolo Sarpi (London, 1619; English translation by Brent, London, 1676), in a spirit of decided opposition to the papal court. Against him wrote Cardinal Sforza-Pallavicino (2 vols., Rome, 1656-'7). A work on the discrepancies of both has been published by Dr. Brischar (2 vols., Tübingen, 1848). Mendham's "Memoirs of the Council of Trent" (London, 1834) contains extracts from 28 volumes of manuscripts collected in Italy by Lord Guilford. See also Waterworth's history of the council prefixed to his translation of its canons and decrees (London, 1848), and *Étude historique sur le concile de Trente*, by L. Maynier (part i., Paris, 1874). Important "Documents relating to the History of the Council of Trent" have been published from Austrian archives by Tickel (Vienna, 1872). The long expected publication of the original acts of the council, by Augustin Theiner, prefect of the Vatican council, took place in 1874 (*Acta genuina S. Oecumenici Concilii Tridentini*, Agram); the work is believed to give, not the minutes of the council as they were taken down by the secretary, but a careful revision.

**TRENTE ET UN.** See **ROUGE ET NOIR**.

**TRENTON**, a city and the capital of New Jersey and of Mercer co., on the left bank of the Delaware river at the confluence of Assunpink

Trenton. Water is raised from the Delaware to a reservoir N. of the city. The capitol is a handsome stone building, recently enlarged, 240 ft. by 120, stuccoed in imitation of granite. The county court house is in South Trenton. There is also a good city hall. Trenton contains one of the state lunatic asylums, founded in 1848, and having accommodation for 600 patients; the state normal school, established in 1855, and having extensive buildings; the state penitentiary, and the state arsenal. There is now (1876) in course of construction by the United States government a large and handsome building, of Ohio sandstone, intended for the post office and United States courts and offices, to cost \$500,000. The soldiers' children's home and the state industrial school for girls are near by. There are two bridges over the Delaware opposite the city, one 1,100 ft. long, built about 1810, and recently reconstructed of iron, and the other about 1,300 ft. long, completed in 1860. The Delaware and Raritan canal passes through the city, forming a water communication with Philadelphia and New York, and, by its navigable feeder, with Lambertville and New Hope, about 18 m. N. Trenton is connected with Philadelphia and New York by the Pennsylvania railroad, and is the point of junction with the Belvidere Delaware railroad, which runs to the Water Gap and connects with the coal regions of Pennsylvania. The manufacture of crockery is the most important industry, Trenton surpassing all other places in the

country in this respect. There are 18 potteries, producing white granite and brown ware to the value of about \$3,000,000 annually. The city also contains iron foundries, breweries, paper mills, woolen mills, rolling mills, rubber works, zinc works, and manufactories of engines and boilers, wire, terra cotta, belting and hose, edge tools, soap, carriages, nails, saws, scales, &c. There are two national banks with a joint capital of \$1,000,000, a state bank with \$500,000 capital, three savings

State Capitol of New Jersey.

creek, and at the head of steamboat navigation, 28 m. N. E. of Philadelphia, and 55 m. S. W. of New York; lat. 40° 14' N., lon. 74° 46' 30" W.; pop. in 1860, 17,228; in 1870, 22,874, of whom 5,019 were foreigners; in 1875, 25,031. The city is regularly laid out, and lighted with gas. Assunpink creek divides it into nearly equal parts, Trenton and South

banks, and two insurance companies with a joint capital of \$700,000. The city is governed by a mayor and a common council of three members from each of the seven wards. It has street railroads and an efficient fire department. The principal charitable institutions are a home for widows, a children's home, and the hospital of St. Francis. There

are a high school and 11 other public schools, with about 50 teachers and an average attendance of about 2,000 pupils, besides academies and Roman Catholic schools. The state library contains 20,539 volumes, the law library 15,000, and the public library about 5,000. Six daily, one semi-weekly (German), and six weekly newspapers are published. There are 84 churches, viz.: 4 Baptist, 3 Episcopal, 1 Evangelical Lutheran, 2 Friends', 1 Jewish, 1 Lutheran, 1 Messiah, 12 Methodist, 6 Presbyterian, and 8 Roman Catholic.—The first settlement in the vicinity was made about 1680, and was named in 1720 in honor of Col. William Trent, speaker of the house of assembly. It was selected as the capital of New Jersey in 1790, and incorporated as a city in 1792. On the night preceding Dec. 26, 1776, Gen. Washington crossed the Delaware river at McConkey's ferry, and attacked the Hessians, who were encamped in Trenton, surprising and routing them completely, taking about 1,000 prisoners, 6 brass field pieces, 1,200 stand of arms, and the standards of an entire brigade. The Hessians numbered about 1,800, and 17 were killed in the skirmish, while the Americans lost not a man in the fight, although two were frozen to death in recrossing the river. The force of the enemy in the vicinity being superior to Washington's, he returned to his camp on the other side of the Delaware on the night of the 26th.

**TRENTON FALLS**, a village of Oneida co., New York, on West Canada creek and the Utica and Black River railroad, 13 m. N. E. of Utica; pop. in 1870, 128. It is named from the falls in its neighborhood, six in number, occupying at intervals a ravine 2 m. long, with an aggregate descent of 312 ft. The cascades are exceedingly beautiful, and the rocky walls in some places are 150 ft. high.

**TRENTSCHIN** (Hung. *Trenacsény*), a N. W. county of Hungary, bordering on Moravia, Austrian Silesia, and W. Galicia; area, 1,784 sq. m.; pop. in 1870, 248,626, nearly all Slovaks and Roman Catholics. It is traversed by two branches of the Carpathian mountains, and watered by the Waag and its affluents. Its chief products are corn, fruit, flax, and hemp; and it has famous mineral springs. The capital, Trentschin, on the left bank of the Waag, is remarkable for the springs in its vicinity, and for its castle, one of the oldest and strongest in Hungary, situated on a rocky eminence; pop. in 1870, 3,449.

**TREPAN**, and **Trephine** (Gr. *τροπᾶν*, to perforate), two surgical instruments used for removing portions of bone from the skull or other parts of the bony structure. The first was an instrument like a gimlet, to which was attached a crown or cylinder with saw teeth on its lower edge, and which was worked by a rotatory motion till it perforated the bone. Several sizes of these cylinders were furnished. The trephine is of later invention. It has a cylindrical saw, but no gimlet. A sharp steel

point called a centre pin, which can be pressed into the bone until the saw has made a groove for itself, passes down the centre of the instrument, and is removable by the operator as soon as the groove is made. The cutting is accomplished, not as in the trepan by a rotatory movement, but by semi-rotation, as in boring with an awl. The method of trephining is as follows: A crucial incision is made down to the bone, and the periosteum being dissected up, the trephine is applied, the centre pin being removed as soon as the track of the instrument is fixed, and the instrument itself raised every few strokes in order to see that it is not cutting through on either side, upon the tissues below. The greatest danger is when the circular piece is nearly separated; and some operators raise the cut portion by means of the elevator, rather than permit the instrument to divide it completely. The spicula of bone which may remain around the orifice are carefully removed by means of forceps. Trephining has been considered as indicated when there is a fracture of a portion of the skull, from a fall or blow with a blunt instrument, in order to elevate the depressed portion; in some cases of concussion, where there is reason to believe that the inner table of the skull is fractured at the opposite side of the head, and is producing irritation of the brain; in cases where extravasation, of blood has taken place under the meninges of the brain from injuries or disease, or where purulent matter has accumulated under the meninges; in caries affecting the bones of the skull, the sternum or breast bone, or the tibia; and in some cases of a collection of purulent matter under the sternum. During the middle ages, in the "heroic" period of surgical practice, trephining was one of the most common operations of surgery. Of late years the operation is but seldom practised. Hey's saw, with a shaft and handle like a common steel fork, and having a plate of steel  $1\frac{1}{2}$  in. in breadth and perhaps  $1\frac{1}{2}$  in. long attached to it, one edge of which is a straight and the other a convex saw, has almost entirely superseded the trephine for most of those injuries of the skull which were formerly thought to require its use. By this instrument the depressed portion is itself removed, instead of that which was not fractured, and the injuries to the skull can be remedied with far less loss of bony structure than under the old system.

**TRESPASS** (Norman Fr. *trèspasser*, from *très*, beyond, and *passer*, to go), in law, as usually defined, a wrongful act, committed with some kind of violence, and injurious to the person, property, or rights of another. Its literal meaning is precisely the same as transgression; it is a step beyond the limits of law or right. In the old law Latin the word *transgressio* was used where trespass is used in English. Formerly the two words were employed in writing and conversation with the same meaning, but now trespass is commonly used

only in the legal sense, and is an important law term. Familiar examples of trespass are assault and battery, forcible entry into a house or upon lands, breaking open a door, and tearing down a fence. Such acts are in law trespasses *vi et armis*, or, in the English phrase now used in indictments and declarations, trespasses with force and arms. Early in the history of the law a very slight degree of violence was sufficient to constitute this offence; and soon afterward the law held that it might be committed in some cases without any actual force whatever, implying by construction the force necessary to make it a trespass *vi et armis*, if the act were unlawful. Thus, for example, a peaceable entry into a house or land, with intent to take possession and oust the true owner, was regarded as a trespass *vi et armis*. Soon after there grew up a large and very important class of trespasses, where there was neither actual nor constructive force. The courts in fact invented a form of action, by means of which remedies might be given for a great number of injuries, to which the law of trespass with force and arms could not be made applicable by any construction. This new legal trespass was called, in the law Latin in use when the action was first employed, *transgressio super casum*, and is now called a trespass on the case. In the days of special pleading it had become very difficult to determine whether the action by which redress was sought for in certain injuries should be trespass or trespass on the case; and if the plaintiff mistook his form of action, he wholly failed. But by recent statutes, with the rules of court and the amended practice, if a mistake be made it may be corrected without delay and without cost. Trespass with force and arms (or trespass alone, for the latter clause is often omitted) lies when the injury complained of is itself the wrong done by the defendant; while trespass on the case lies when the injury was consequential upon the wrong done, and flowed from it indirectly. For example, trespass on the case lies for an injury sustained by the plaintiff from the defendant's sale to him of unwholesome food, as meat or wine, especially where it was the business of the defendant to sell these things. So for an injury caused by the want of skill of any person in the exercise of his profession, as a physician or lawyer. There is yet another nice and very important distinction in the law of trespass. A man may begin by doing a right thing in a right way, and then so change his course as to do a wrong thing, or a right thing in a wrong way. In some of these cases such a person thus subsequently trespassing is regarded by the law as a trespasser *ab initio*, or as having been a trespasser through the whole of his conduct. Thus, if, in the execution of a legal process, he does something which is distinctly illegal, the law considers that he began to act with intent to do an illegal thing, and that all of his conduct was tainted by this intention and

was therefore illegal. The doctrine is applied only where the wrong was done while in the exercise of a strictly legal right, which the injured party had no right to resist, and seems to be confined by the best authorities to the cases of an officer of the law acting under a legal warrant, and a guest at an inn.

**TREVES** (Ger. *Trier*), a town of Rhenish Prussia, on the right bank of the Moselle, 57 m. S. W. of Coblenz; pop. in 1871, 21,442. It is a decayed place, noted for its ultramontanism and for a cathedral which exhibits the development of the Romanesque style from the earliest period down to its completion in the 12th century, and contains remarkable altars, tombs, missals, and relics. (See *Der Dom zu Trier*, by Wilmowsky, Treves, 1875.) Among the relics is the so-called "holy coat," which pilgrims revere as the seamless garment of the Saviour, and believe to have been deposited in the church by the empress Helena, the alleged founder of the building. The great agitation

Porta Nigra, Treves.

which resulted in 1844 from the multitudes (estimated at more than 1,000,000) flocking to this shrine was the main origin of the German Catholic denomination. Adjoining the cathedral is the *Liebfrauenkirche* of the 18th century, one of the earliest and finest specimens of pure Gothic. The university, founded in 1472, was superseded in 1798 by a gymnasium, which contains a city library of 100,000 volumes. In the old electoral palace are the barracks. The Roman antiquities, more numerous here than anywhere else in Germany, include part of the bridge over the Moselle, an amphitheatre, baths, and the colossal quadrangle known as *porta nigra*, the most conspicuous of all. The chief articles of trade are fruit, wine, timber, stones, and woollen and other manufactures.—Treves was originally occupied by the Treviri, a Celtic tribe of Belgic Gaul, and under the Romans became the capital of a province under the name of Augusta Trevirorum. In the 4th century the town was improved by Constantine

the Great. Under the Franks it was included in the kingdom of Austrasia, and afterward belonged alternately to Lorraine and Germany, till in the 10th century it was permanently annexed to the latter country. Subsequently, under the rule of archbishops, it became with its territory the second German electorate, divided into an upper and lower see, the latter connected with the episcopal capital at Co-blentz. The city of Treves was invested with sovereign rights from 1580 till its occupation by the French in 1794. The whole electorate was in 1797 incorporated with France. In 1814 Treves was annexed to Prussia. The suppression of the priests' seminary, Dec. 31, 1873, and the subsequent imprisonment of the bishop, produced disturbances which were quelled in March, 1874.

**TREVIRANUS.** I. *Cottfried Reinhold*, a German naturalist, born in Bremen, Feb. 4, 1776, died there, Feb. 16, 1837. He studied medicine at Göttingen, and after practising at Bremen became in 1797 professor of mathematics in the lyceum of that city. His works include *Physiologische Fragmente* (2 vols., Hanover, 1797-'9); *Biologie oder Philosophie der lebenden Natur* (6 vols., Göttingen, 1802-'22); *Erscheinungen und Gesetze des organischen Lebens* (2 vols., Bremen, 1831-'2); and with his brother *Vermischte Schriften anatomischen und physiologischen Inhalts* (4 vols., Göttingen and Bremen, 1816-'21). II. *Ludolf Christian*, a German botanist, brother of the preceding, born in Bremen, Sept. 10, 1779, died in Bonn, May 6, 1864. He became professor of medicine at Berlin in 1807, of botany and natural history at Rostock in 1812, professor of botany and director of the botanic garden at Breslau in 1816, and afterward at Bonn. He is chiefly known by his *Physiologie der Gewächse* (2 vols., Bonn, 1835-'9).

**TREVISIO.** I. A N. E. province of Italy, in Venetia, bordering on the gulf of Venice; area, 941 sq. m.; pop. in 1872, 352,538. It is level, excepting in the north, and is one of the most fertile regions of that part of Italy. The main river is the Piave. The chief products are hemp, flax, grain, wine, and timber. It is divided into the districts of Treviso, Ceneda, Castelfranco, Oderzo, Asolo, Valdobbiadene, Montebelluno, and Conegliano. II. A fortified city (anc. *Tarvisium*), capital of the province, on the Sile, 15 m. N. N. W. of Venice; pop. in 1872, 28,291. It is the seat of a bishop, and has an unfinished cathedral, with works by Titian and Paul Veronese, a large Gothic church, a celebrated palace of justice, a lyceum, gymnasium, seminary, and academy of science. In the 13th century it was captured and oppressed by Ezzelino da Romano; in the 14th it was successively ruled by Francesco della Scala of Verona, by Venice, Austria, and Padua, and was with its territory in the possession of Venice from 1888 till the occupation of the town in 1797 by the French under Mortier, who in 1807 received the title of duke of Tre-

viso. It afterward belonged to Austria. In March, 1848, it was taken by the revolutionists, but the Austrians regained it on June 24, after a second bombardment. In 1866 it became part of the kingdom of Italy.

**TRIADITZA.** See SOPHIA.

**TRIAL.** See JURY, and PROCESS.

**TRIBONIANUS**, a Roman jurist, died A. D. 545. Under Justinian he occupied the offices of *quaestor sacri palatii*, of *magister officiorum*, of praetorian prefect, and of consul. He is described as a man of great natural abilities and learning, but avaricious and corrupt. In 528 he was one of the ten commissioners selected by the emperor to form his first Codex, and in 530 was placed at the head of the committee to compile the Pandects or digest of Roman laws, which was finished and promulgated in 529. He at the same time, with two others, compiled the four books of the Institutes of Justinian, published in 529; and the second Codex of that emperor, published in 529, was the work of Tribonianus and four other jurists. (See CIVIL LAW.)

**TRIBUNE** (Lat. *tribunus*), originally, a Roman officer who presided over one of the three tribes, Ramnenses, Titienses, and Luceres. In the long course of Roman history the name came to be applied to various officers with widely different powers and duties. As originally constituted, the Roman legion consisted of 300 cavalry and 8,000 infantry; over the cavalry presided an officer called *tribunus celerum*, and over each 1,000 of the infantry a *tribunus militum*. The *tribuni celerum* disappeared with the overthrow of the monarchy. The office of the *tribuni militum* continued through the whole course of Roman history, but the manner of their appointment, their number, and their powers and duties were often changed. "Tribunes of the soldiers, with consular power," were first chosen in 444; and in succeeding years sometimes consuls and sometimes tribunes with consular power were chosen. In 367 the office was abolished, and thereafter only consuls were chosen. The name "tribune of the Servian tribes" is applied by historians to the administrative chiefs of the local tribes which were gradually added to the Roman commonwealth; it is supposed by Niebuhr and others that the tribunes of the treasury of later times were similar to them.—The "tribunes of the people" were the most important of all the officers bearing the name. They were first appointed after the secession of the commonalty to the Mons Sacer, in 494. They were empowered to protect the plebeians against the usurpations of the patrician magistrates, and their persons were declared sacred and inviolable. They appear to have been originally two in number, and to have been elected for one year by the comitia of the centuries. In 471, by the Publilian law, the election was given to the comitia of the tribes. About the same time the number was increased to five, and from 457 B. C. until the end of

the empire ten tribunes were annually elected. None but plebeians were eligible for the office; so that if a patrician were desirous of filling it, he was obliged to renounce his own order. The early incumbents of the office exercised authority within the city limits and over one mile of adjacent territory; the doors of their houses were ordered to be open day and night, and all persons taking refuge there were assured of protection. For similar reasons they were forbidden to absent themselves from the city for a whole day. Although their lawful power was originally merely *auxilium*, or the right to afford protection, they assumed within a few years the right to convoke the senate, and in 454, after a long struggle, secured the appointment of the three commissioners whose labors led to the codification of the laws of the twelve tables. During the second decemvirate the tribunate was suspended, but with the overthrow of that oligarchy it was restored with augmented powers; and as the tribes now included patricians and their clients as well as plebeians, the tribunes became the protectors of all classes of citizens. They now also acquired the right to be present at the deliberations of the senate, and to take part in its discussions, although not allowed to pass within the doors of the senate house; and hence they gradually assumed the privilege of intercession against any action taken by a magistrate, and by the interposition of their veto were enabled to annul any decree of the senate or stop any law, without cause or reason assigned. On the other hand, they sometimes interfered to compel the consuls to comply with decrees of the senate. About 182 B. C. they became senators by virtue of their office. They also assumed the right of commanding their *viatores* or attendants to seize a refractory magistrate, and imprison him, or even to hurl him from the Tarpeian rock. They possessed the exclusive power of proposing *plebiscita* to the comitia of the tribes; and after these had obtained by the Hortensian law, 286 B. C., the binding force of laws, the tribunes became a magistracy for the whole Roman people, in opposition to the senate and the oligarchical elements in general, although they had nothing to do with the administration of the government. Subsequent to 394 B. C. the veto of a single tribune sufficed to render a resolution of his colleagues void; and it was not until Tiberius Gracchus introduced the practice of appealing to the people to remove a tribune who obstinately adhered to his veto, that the harmonious working of the system was restored. During the latter period of the republic Sulla, in his reform of the constitution on an aristocratic basis, gave the tribunes merely the *ius auxilii* which they originally possessed. Pompey restored them to their former power, but under the empire their privileges became much restricted, although until the 5th century they continued to have the right of intercession against decrees of the senate and on be-

half of oppressed individuals. The emperors, though patricians, found it necessary to be tribunes, and the *tribunicia potestas*, conferred by the senate upon Augustus and his successors, was considered an essential part of the imperial dignity.—After Diocletian there was an officer called *tribunus voluptatum*, who was the superintendent of public amusements.

**TRICHINA SPIRALIS.** See ENTROZOA, vol. vi., p. 669.

**TRICHINOPOLY**, or *Trichinapalli*, a town of British India, capital of a district of the same name in Madras, on the right bank of the river Cavery, in lat. 10° 47' N., lon. 78° 48' E., 190 m. S. S. W. of the city of Madras, with which it is connected by rail; pop. about 80,000. The fort of Trichinopoly is built on a granite rock about 600 ft. high. Outside the densely populated native town, which was formerly enclosed within the walls of the fortress, are extensive barracks, hospitals, public rooms, a church and Roman Catholic chapel, and the tomb of Bishop Heber, who died here. The surrounding country is fertile and populous; and the island of Seringham, which is here formed by the Cavery, is famous for the size and wealth of the Hindoo pagodas upon it. Trichinopoly is the southernmost station of British troops in India, and was occupied by 169 European infantry in 1872-'8. Cotton cloths, hardware, harness, cheroots, indigo, and jewelry are manufactured and exported to different parts of India and Mauritius.—Trichinopoly, after the death of its last rajah in 1782, fell under the sway of the nawab of Arcot, and subsequently changed hands several times, figuring conspicuously in the contests of the French and English for supremacy in India. It finally came under English government with the rest of the Carnatic in 1801.

**TRICOLOR.** See FLAG, vol. vii., p. 250.

**TRICOUPI**, *Spiridon*, a Greek historian, born in Missolonghi in 1791, died in Athens, Feb. 24, 1873. He held important offices at Athens after the Greek revolution, which he had promoted, and was minister at London at various periods, lastly from 1850 till King Otho's downfall in 1862. He was a friend of Lord Byron, on whose death he pronounced one of his most celebrated orations. His chief work is *Ἱστορία τῆς Ἑλληνικῆς Ἐπαναστάσεως* ("History of the Greek Revolution," 4 vols., London, 1853-'7; 2d ed., 1862).

**TRIER.** See TREVES.

**TRIESTE** (Ger. *Triest*). I. A district of Cis-leithan Austria, forming a part of the Littorale, and bordering on the Adriatic, Görz, and Istria; area, 86 sq. m.; pop. about 182,000, of whom more than one half are Slovenes, more than one third Italians, 8 per cent. Germans, and 4½ per cent. Jews. II. A city (anc. *Tergeste*), capital of the district, and the principal seaport of Austria, beautifully situated at the head of the gulf of Trieste, or N. E. coast of the Adriatic, 70 m. E. N. E. of Venice and 210 m. S. W. of Vienna; pop. in 1870, including

suburbs, 109,324. It consists of the old town, with a fortified castle, the new or Theresa town, and the new Joseph and Francis suburbs, with capacious streets and many squares and promenades. The finest public building is the chamber of commerce, formerly the exchange building. The monuments include the statue of Leopold I., and that by Rosetti of Winckelmann, who was murdered here. The cathedral is remarkable chiefly for walled-in antiquities. The recently opened Protestant church is one of the finest in the city. Trieste is the seat of a bishop, and has a theological seminary and many schools, besides a commercial and naval academy with an observatory, a museum rich in botany, and a public library. The "Adriatic Scientific Society" was established in 1874. The Tergesteum is the building of the Austrian Lloyd's, which company

for steamboat navigation and miscellaneous enterprises is one of the largest organizations of the kind in the world. Trieste is Italian in appearance and in language, though much German is spoken. There are Greek and English merchants. The constant arrival and departure of steamers make the port very lively; but the increase of commerce and population is of comparatively recent origin. In 1758 the population was only 6,000. In 1873 the arrivals of vessels numbered 8,046, chiefly Italian and Austrian, and the departures 8,219, with a respective tonnage of 898,437 and 909,402. The imports, chiefly coal, grain, iron, and oil, amounted to 140,164,000 florins, and the exports, mainly grain, flour, timber, and staves, to 92,877,000 florins. This was a decline from previous years, due to the competition of Hamburg; and the sanguine expecta-

Trieste.

tions of increasing the importance of Trieste in the India trade have been rather damped since the opening of the Suez canal. Its status as a free port is limited by the government monopoly of gunpowder, salt, and tobacco, and by an excise upon wine, spirits, and other articles. A breakwater for protecting the port was begun in 1866, and an abortive attempt was made in 1874 to fill up the malarious part of the *canale grande*, originally intended to supplement the port and the roads.—Tergeste was originally settled either by the Carnians or Istrians. The earliest historical mention of it as a Roman town dates from 51 B. C. Augustus laid the foundation of its prosperity. It was under the dominion of the Ostrogoths, and afterward of the Greek emperors, till the period of the Lombard invasion. Subsequently Trieste became independent under its bishop, who bore the

title of count, and who gradually sold to the inhabitants the privileges of a free city. Long wars ensued with the patriarchate of Aquileia, which claimed the allegiance of the bishops of Trieste, and in these wars Venice and Genoa also took part. The peace of Turin in 1381 acknowledged Trieste as an independent city, and the next year the citizens voluntarily submitted to the house of Austria. Charles VI. declared it a free city in 1719, and Maria Theresa made it a free port in 1750. It was taken by the French in 1797 and 1805. From 1809 to 1814 it belonged to the French province of Illyria, and subsequently to the Austrian kingdom of that name till 1849, when the so-called kingdom was dissolved. In reward for its fidelity to Austria during the revolutionary period of 1848-'9, when the port was blockaded by an Italian squadron, the city and district were invested on Oct. 2, 1849, with the privi-

leges of local self-government; and by the constitution of Dec. 21, 1867, they were made a constituent part of the Littoral province.

**TRIGG**, a S. W. county of Kentucky, bordering on Tennessee, bounded W. by the Tennessee river and drained by the Cumberland river; area, 530 sq. m.; pop. in 1870, 13,686, of whom 3,806 were colored. The surface is hilly and the soil fertile in parts. Horses, cattle, mules, and swine are exported in great numbers. Iron, bituminous coal, and limestone are found. The chief productions in 1870 were 99,371 bushels of wheat, 589,820 of Indian corn, 16,114 of oats, 14,805 of Irish and 18,832 of sweet potatoes, 8,614,368 lbs. of tobacco, 18,442 of wool, 83,808 of butter, and 584 tons of hay. There were 2,673 horses, 1,908 mules and asses, 2,440 milch cows, 8,311 other cattle, 9,489 sheep, and 24,288 swine; 4 flour mills, 1 manufactory of pig iron, 4 tanneries, 4 currying establishments, and 3 saw mills. Capital, Cadiz.

**TRIGONOMETRY** (Gr. *τρίγωνον*, a triangle, and *μετρέιν*, to measure), the branch of mathematics which treats of the measurement of triangles. The practical object in nearly all applications of the science is to measure indirectly some height or some distance the direct measurement of which would be inconvenient or impossible. The labors of the civil engineer and the astronomer consist in great part in a constant application of the principles of trigonometry, and the best treatises on the subject, like that of Prof. Peirce, include also treatises on surveying, navigation, and spherical astronomy. Trigonometry is divided into plane and spherical, the former treating of plane triangles, the latter of spherical triangles. In surveying and ordinary engineering operations plane trigonometry is mostly employed; in the higher problems of navigation, in engineering operations conducted on a grand scale, as in the coast survey, and in astronomy, spherical trigonometry is indispensable. But the general principles are the same in both branches. As spherical trigonometry consists essentially in an extension of the principles of plane trigonometry, we shall confine our attention to the latter. In every plane triangle there are six elements to be considered, three sides and three angles. The angles depend upon the proportions of the sides, and conversely the proportions of the sides depend upon the angles. If we know the three angles, we can find the ratio which any one side bears to each of the others, but we cannot find the length of any one of them; hence it is necessary for the complete determination of all the elements of a triangle, that we should know the length of at least one side. In calculating the unknown elements of a triangle certain ratios are employed, called "trigonometrical functions," which depend upon the angles. One quantity is said to be a function of another when its value depends upon the value of the other. The ordinary method of measuring angles is explained under **ANGLE**.—There are

two methods of explaining the trigonometrical functions. The one, which may be called the ancient method, is presented in nearly all the text books in use before the middle of the present century; the other or modern method is followed in the best text books of recent date, and is fast superseding the former. In the old system the trigonometrical functions are lines, in the new system they are abstract numbers expressing the ratios of lines. A brief explanation of the modern system will enable the general reader to form an idea of the nature and objects of the science. Draw two lines,  $CA$ ,  $CB$ , fig. 1, forming an angle at  $C$ . At any point in either line, say at  $P$  in the

FIG. 1.

line  $CB$ , erect a perpendicular to  $CB$ , intersecting  $CA$  in  $D$ . It matters not where in the line  $CB$  the point  $P$  is; so long as the angle at  $C$  remains unchanged, the proportions of the lines  $CD$ ,  $CP$ , and  $PD$  will remain the same. In the figure the angle at  $C$  is intended to be an angle of  $30^\circ$ ; and with this angle, if  $CD$  is an inch,  $PD$  will be half an inch, and if  $CD$  is ten miles,  $PD$  will be five miles; in other words, with an angle of  $30^\circ$ ,  $PD$  is always half of  $CD$ . The number  $\frac{1}{2}$  is called the "sine" of  $30^\circ$ , or  $\frac{PD}{CD} = \frac{1}{2} = \text{sine of } 30^\circ$ . If the angle

$C$  be altered, the ratio  $\frac{PD}{CD}$  will change, and hence the sine is said to be a function of the angle. But the sine does not vary directly as the angle. When the angle is a right angle or  $90^\circ$ , the lines  $CD$  and  $PD$  fall together and become one line, and their ratio is 1, or the sine of  $90^\circ = 1$ ; and although the angle is three times  $30^\circ$ , the sine is only twice the sine of  $30^\circ$ . The ratio of  $CP$  to  $CD$ , or  $\frac{CP}{CD}$ , is called the "cosine" of the angle at  $C$ . The cosine of  $30^\circ$  is the decimal fraction 0.866 very nearly. The ratio of the sine to the cosine, or of the line  $PD$  to  $CP$ , is called the "tangent" of the angle at  $C$ . The tangent of  $30^\circ$  is  $\frac{1}{2}$  divided by  $\frac{\sqrt{3}}{2}$ , or, in decimals correct to three places, 0.577. The sine and cosine are never greater than 1, and hence in all cases except where the line  $CD$  coincides with one of the other lines, the sine and cosine are fractions. The tangent may have any value. Thus the sine of  $89^\circ 8'$  is 0.99986, and the cosine is 0.01658; both are fractions less than 1, but the former contains the latter more than 60 times,

and the tangent of  $89^\circ 3'$  is 60-3058. The reciprocals of the sine, cosine, and tangent (that is,  $\frac{1}{\text{sine}}$ ,  $\frac{1}{\text{cosine}}$ ,  $\frac{1}{\text{tangent}}$ ) are called respectively the cosecant, secant, and cotangent of the angle at C. If the cosine be subtracted from 1, the remainder is called the "versed sine;" and if the sine be subtracted from 1, the remainder is called the "covered sine." In practice these names are always abbreviated. Instead of "sine of  $30^\circ$ " it is always written  $\sin 30^\circ$ , and, putting C for the angle, the abbreviations are as follows:  $\sin C$ ,  $\cos C$ ,  $\tan C$ ,  $\csc C$ ,  $\sec C$ ,  $\cot C$ ,  $\text{covers } C$ , and  $\text{vers } C$ . These terms all indicate numbers depending on the value of the angle, and are called the "trigonometrical functions." The value of these functions has been calculated for all possible angles which our most delicate instruments enable us to measure, and these values are recorded in tables, so that, any angle being given, the functions can be found, or any function being given, the angle can be found, by simply looking in the tables. The numbers employed in trigonometry, especially where great accuracy is required, often contain so many digits that the labor of calculation would be intolerable were it not for the use of logarithms. The tables generally used in practice contain, not the actual values of the functions, but the logarithms of those values. Tables of the actual values are also published, and they can be easily found, if wanted, from their logarithmic values by means of a table of the logarithms of numbers. A single example of the use made of these functions will show how measurements can be made which without them would be inconvenient or impossible. Suppose a person at B, fig. 2, on the bank of a river, on

FIG. 2.

the opposite side of which is a lofty hill, whose highest peak H he can see with his telescope. He wishes to know the perpendicular height of the peak (H X) above the plain C B. Supposing him to be provided with the proper instruments for measuring angles, he takes a sight at the peak H and finds that the angle of elevation X B H is  $28^\circ 41'$ . Subtracting this from  $180^\circ$ , he finds the angle H B C =  $151^\circ 19'$ . Next he measures back from the river say 1,000 ft. to C, and then takes another sight at the peak and finds that the angle H C X is  $18^\circ 4'$ . The rest is matter of calculation and looking in the tables. The angles are quickly and easily measured, and the only physical labor of any consequence is the carrying his

instruments from B to C and measuring the distance of 1,000 ft. between them. Any other distance than 1,000 ft. would have answered the purpose; but, for reasons which it is not necessary to enter into, it will save trouble and insure accuracy to have the distance B C as near as a rough guess will give to B H. Geometry tells us that if from the angle H B X =  $28^\circ 41'$  we subtract the angle H C B =  $18^\circ 4'$ , we shall get the angle C H B, between the two lines of sight. We thus find C H B =  $10^\circ 37'$ . The text books on trigonometry show that in every triangle the sines of any two angles are to each other as the sides opposite the angles. Looking in a table of natural sines (that is, of the actual values, and not the logarithms), we find the sine of  $10^\circ 37'$  is the decimal fraction 0.18424, and the sine of  $18^\circ 4'$  is 0.31012. The side opposite the angle C H B we have measured, and hence we have the proportion, or "sum in the rule of three:" as 0.18424 is to 0.31012, so is 1,000 to B H, the side opposite the angle H C B. Making the calculations, which are much more easily made by means of logarithms, we get 1683.28 ft. as the distance from B to H. We now apply the same process to the triangle B H X. The angle B H X is a right angle, and its sine is 1. The sine of  $28^\circ 41'$  is 0.47997; hence, as 1 is to 0.47997, so is 1683.28 to H X, the height which we wished to find; making the calculations, we find it to be 807.92 ft., or, taking the nearest foot, we say the peak is 808 ft. high. We have only made use of the sines; but all the other functions may come into play, according to the nature of the problem.—The great mathematicians of modern times have shown how trigonometry can be treated as a branch of pure algebra, and all its formulas developed without any reference to triangles. They have also shown how in this abstract form it can be applied to geometry, and a perfectly intelligible explanation given to what are called imaginary or impossible quantities. Treated in this manner, it constitutes the connecting link between the mathematical sciences of the present and those higher but as yet undeveloped branches of the mathematics of the future that have been referred to in the article GEOMETRY, and the foundations of which have been laid in the "Quaternions" of Hamilton, the *Ausdehnungslehre* of Grassmann, and the "Linear Associative Algebra" of Peirce.—Among the multitude of works on the science, the following are of special excellence: A. De Morgan, "Trigonometry and Double Algebra" (London, 1849); J. Todhunter, "Plane Trigonometry" (4th ed., London, 1869) and "Spherical Trigonometry" (3d ed., 1871); L. Mack, *Goniometrie und Trigonometrie* (Stuttgart, 1860); and O. Briot and A. Bouquet, *Leçons nouvelles de trigonométrie* (4th ed., Paris, 1862). (For the application of trigonometry to surveying, see COAST SURVEY, and SURVEYING.)

**TRILLIUM** (Lat. *trilix*, triple, the parts being in threes), a genus of North American plants,

now placed in a suborder of the lily family. They are perennial herbs with a short tuber-like rootstock, from which rises a simple, naked stem, usually less than a foot high, bearing at its summit a whorl of three ovate or rhomboid, netted-veined leaves, above which is a terminal flower, usually large, succeeded by an ovate, purple or red, three-celled berry. The trilliums, of which there are about a dozen species, are among the most striking of our spring flowers; their symmetrical structure and the beauty of the flowers in most species are interesting and attractive; they grow in rich moist woods or bogs, some extending from Canada to Georgia, one being peculiar to the far southern states, and two or three to the Pacific coast. The plants have received various common names, among which are three-leaved nightshade, wakerobin, birthroot, bethroot, and Indian balm. The great-flowered trillium (*T. grandiflorum*) is the

Large-flowered Trillium (*Trillium grandiflorum*).

showiest species; its pure white flowers, often 3 in. across, and becoming rose-colored with age, are erect and raised above the leaves on a peduncle 2 to 3 in. long. The purple trillium (*T. erectum*) has rather smaller, dull purple flowers. The red-fruited species (*T. erythrocarpum*) has its white petals marked at the base with pink or purple stripes. The nodding trillium hides its flowers beneath the leaves by the recurving of its stalk. *T. sessile* often has its leaves blotched with two shades of green; and the related *T. discolor*, the southern species, has very ornamental foliage from being variegated with green and brown or purple. All flourish well in the garden, *T. grandiflorum* being especially ornamental; large numbers of its tubers are sent to Europe, to be sold by the bulb dealers. The roots of *trillium* contain an acrid principle analogous to senegine and saponine, as well as a volatile oil, resin, and tannic acid. They are astringent, and are said to be tonic and expectorant.

**TRILOBITE** (Gr. *τρεῖς*, three, and *λόβος*, lobe), the name of a group of fossil crustaceans, so called from the three lobes into which the body is divided. They do not correspond exactly to any living group, but, according to Burmeister ("Organization of Trilobites," Ray society's publications, 4to, London, 1846), were a peculiar family of crustaceans, nearly allied to the existing *phyllopoda* (like *apus* and *branchipus*), and forming a connecting link between these and the entomostracan *pacilopoda* (like *argulus*, *caligus*, and other parasites called fish lice); they come nearest to *phyllopoda*, especially in the double large eyes, undeveloped antennæ, and soft membranous feet, and nearest of all to *branchipus*; a marked resemblance in the form of the *limulus* (king crab, or common horseshoe of our coasts), especially the larva, is also observed to that of many species of trilobites. (See KING CRAB.) The general form of the animal is oval, divided into three well defined regions, the head or buckler, the thorax, and the abdomen or *pygidium*, the last two composed of semicircular plates or segments, varying in number, by whose movements the animal could roll itself into a ball like the common wood louse and pill bug (*oniscus* and *armadillo*). Each of these three divisions presents three lobes limited by two longitudinal depressions; the head is generally the largest and considerably the widest, varying from one fourth to one half the total length, semicircular, with a border often ornamented with granulations, depressions, and spines; the middle portion is the *glabella*, the grooves which mark its lateral limit corresponding, according to Barrande, to the insertion of the jaws or first pair of feet; the different pieces are united by distinct sutures, which are important zoological characters. Eyes have been denied to some genera; some had eyes when young, but lost them when old; others had two well formed, compound, faceted, prominent eyes, which are often perfectly preserved in the fossil state; they are sometimes larger than half the length of the head, the greatest diameter being almost always the longitudinal; they had no simple eyes. Traces of a mouth have been distinguished in a few; no traces of antennæ have been found, and they were probably short and feebly developed. The number of the thoracic segments varies in different genera and at different stages of growth, but is constant in adults of the same species; the terminal portions on the sides are the *pleura*, and are curved backward and sometimes very long; traces of nine pairs of feet have been discovered, and they were doubtless soft, membranous, and leaf-shaped, as in *phyllopoda*. The *pygidium* was made up of segments like those of the thorax, but consolidated to form a posterior buckler; it was usually semicircular, less long than wide, developed inversely to the thorax, and largest in the more recent genera. The shell had a thinner horny membrane cover-

ing it, becoming more delicate toward the median line; between the two is found in the fossils a stony layer measuring their distance from each other; the lower surface was soft and membranous; the skin was undoubtedly cast as in other articulata, and Wahlenberg has suggested that some supposed new species may have been founded on their cast shells. They have been divided into three families, according to the nature of their covering: 1, *eurypterida*, without shell, including the single genus *eurypterus* (De Kay); 2, *cytherinida*, with bivalve, bean-shaped shell, including the single genus *cytherina* (Lam.); and 3, *trilobitida*, with a shell having as many rings as there are joints to the body, containing many genera and species, and divided into two large groups, one with the power of rolling into a ball, like *calymene*, and the other with no such power, as in *ogygia*. According to Burmeister, the trilobites moved only by swimming, just below the surface of the water, with the back downward, rolling into a

Calymene.

ball when danger threatened from above, and did not creep upon the bottom; they lived in shallow water, near the coast, associating in immense numbers, chiefly of the same species; while only six or eight species occur in a given stratum, the number of individuals was very great; their food consisted of small aquatic animals and their spawn; they underwent progressive metamorphoses, and varied considerably according to age; their metamorphoses are given at length by Barrande, who makes four distinct types, according to the serial development of the different parts.—Trilobites are among the oldest of the articulata; though none are now living, during the palæozoic period they were very abundant, and almost the only representatives of their class. They have been most studied in Bohemia, and by M. Barrande. None are found above the carboniferous rocks, and only two or three in them. Barrande's primordial fauna, or the lower Silurian, has one genus but no species passing to his second fauna or middle Silurian, and this has many genera but no species common to it and the third fauna or upper Silurian, which in turn has several genera passing to the Devonian fauna—the whole series affording remarkable proofs of the limitations of faunæ in time; the distribution of particular genera and species in space was also very circumscribed, probably on account of their feeble locomotive powers. In America several trilobites, especially *paradoxides* and its allied genera, have been met with in slates formerly classed among the metamorphic rocks, as the *P. Harlani* (Green), found in Braintree, Mass., in 1856, by Prof. W. B. Rogers, and this and other trilobites found in Canada and Newfoundland.—The trilobites have long attracted much interest, as well on account of the great numbers in which they have been found in many locali-

ties, as from their singular conformation, and the perfect state in which their forms are preserved. The eye is very beautiful, and its perfection in many of the stony fossils, especially some brought from the Hartz mountains, and from the upper Silurian limestone of Dudley, England, is very remarkable; the facets or lenses, sometimes nearly 400 in number, are like those observed in the eye of the dragon fly and butterfly, and as in these insects are arranged around a conical tube through which the visual rays enter from almost every direction; in the *asaphus caudatus* each eye thus has a range of nearly three fourths of a circle, and both together command a panoramic view. The structure of the eye also indicates the prevalence in those ancient periods of the same conditions of the waters and the atmosphere, as regards their adaptation to the organs of vision, as now obtain.—The geographical range of trilobites is very extensive; these fossils are met with at most distant points, both of the southern and northern hemispheres; they are found all over northern Europe, and in numerous localities in North America, in the Andes of Bolivia, and at the Cape of Good Hope. Trenton Falls, N. Y., has afforded, in the limestone known by its name, fine specimens of the species *calymene Blumenbachii* (Brongn.). Lebanon, Ohio, is another interesting locality. In Adams co., Ohio, Dr. Locke procured an *isotelus*, to which he gave the specific name *megistos*, that measured more than 20 in. in length and 12 in. in width; the *I. gigas* and *paradoxides Harlani* have been found more than 12 in. long. (See "American Journal of Science," 1871, p. 228, and 1872, p. 268.)

Paradoxides Harlani.

ties, as from their singular conformation, and the perfect state in which their forms are preserved. (See "American Journal of Science," 1871, p. 228, and 1872, p. 268.)

**TRIMBLE**, a N. county of Kentucky, bordering on the Ohio river; area, 150 sq. m.; pop. in 1870, 5,577, of whom 456 were colored. The surface is generally hilly and the soil fertile. The chief productions in 1870 were 81,848 bushels of wheat, 209,060 of Indian corn, 38,216 of oats, 12,647 of potatoes, 658,465 lbs. of tobacco, 10,676 of wool, 24,370 of butter, and 1,268 tons of hay. There were 1,906 horses, 1,064 milch cows, 1,882 other cattle, 3,043 sheep, and 6,512 swine. Capital, Bedford.

**TRINCOMALEE**, a town of Ceylon, in the N. E. part of the island, in lat. 8° 34' N., lon. 81° 12' E.; pop. about 20,000. It stands on the N. side of the entrance to a capacious and se-

cure harbor at the foot of well wooded hills and two heights crowned by forts, besides which the port is defended by numerous fortifications which extend for about a mile along the shore. The inner harbor is landlocked, and has the advantage over all other harbors of India of being accessible to all descriptions of ships during both monsoons. The inhabitants are mostly of Tamil origin, from the S. E. coast of India. The trade is of little importance, but precious stones are found in the neighborhood in considerable quantities.—The Portuguese were the first European nation to form a settlement at Trincomalee. They were expelled by the Dutch, who were in turn driven out by the British in 1782; but an insufficient garrison having been left for its defence, it was captured by the French, who restored it to the Dutch. In 1795 the British again captured it after a siege of three weeks, and it has since remained in their possession.

**TRINIDAD**, one of the British West India islands, at the mouth of the gulf of Paria, off the N. E. coast of Venezuela, opposite the N. mouth of the Orinoco, between lat. 10° and 11° N. and lon. 61° and 62° W.; length N. and S. about 50 m., average breadth 85 m.; area, 1,755 sq. m.; pop. in 1871, 109,688. Its N. W. and S. W. extremities are within 7 and 13 m. respectively of the continent. There is excellent anchorage between the island and the mainland, and there are several good harbors. It is crossed by three ranges of hills from W. to E., extending through the centre, and bordering the S. and N. coasts, the northern range attaining an elevation of 3,000 ft. There are level and undulating tracts in the valleys, but in some places the surface is considerably broken, and it is drained by rivers with numerous tributaries. Much of Trinidad appears to have been formed by the mud deposited by the Orinoco. The mountains consist of clay and mica slate; and quartz, pyrites, arsenic, alum, sulphate of copper, graphite, and sulphur are found. In a volcanic district on the W. coast there is a celebrated asphalt lake. (See ASPHALTUM, and BITUMEN.) At Port of Spain, the capital, the temperature ranges between 74° and 86° in summer, and 70° and 81° in winter. The annual fall of rain is 65 inches; the island is beyond the range of hurricanes. The soil is fertile, and the elevated parts are covered with dense forests. The chief productions are sugar cane, coffee, and cacao; and cotton, indigo, tobacco, nutmegs, cinnamon, and cloves are raised. The indigenous animals are two species of small deer, the opossum, armadillo, porcupine, ant bear, sloth, muskrat, tiger cat, two species of lizards, and numerous monkeys. Fish are abundant. The settlements are chiefly on the N. W. coast and in the adjacent valley. A considerable trade is carried on with the United States in lumber and provisions. Trinidad is a crown colony, under a governor with executive and legislative councils.—The island was discovered by

Columbus in July, 1498, occupied by the Spaniards in the 16th century, captured by the French in 1676, but soon restored, and taken by the British in 1797.

**TRINITY** (Gr. *τριάς*, Lat. *trinitas*), a term of Christian theology denoting the coexistence in the Godhead of three persons, distinguished from each other as the Father, the Son, and the Holy Ghost or Holy Spirit. The doctrine of the Trinity is held by the Roman Catholic church, and by most of the Protestant and eastern churches. The doctrine, it is contended, is contained in all its constitutive elements in the Scriptures, and was gradually drawn up into a systematic statement as the necessity occurred of preserving or vindicating it in its integrity and purity. Supplementary to the ecclesiastical form of the dogma itself are certain theological explanations, throwing on it a fuller light, derived from the teachings of early councils, the writings of the great church fathers, or the accepted scientific language of the schools. These regard the mode of origination of the second and third persons, the relations existing between the persons in the Trinity, and their distinctive characteristics and appellations. While the word Trinity is not to be found in the Bible, and while no passage can be adduced from the Old Testament in which the doctrine of the Trinity or its equivalent is distinctly and explicitly formulated, many texts have been quoted even by the earliest Christian writers which point to the existence of some form of plurality in the Godhead. These texts, however, being susceptible of various interpretations, are not produced as proving peremptorily the doctrine of a Trinity, but as foreshadowing the clear and distinct revelation believed to have been made in the New Testament. From it two large classes of texts are quoted as arguments for establishing the doctrine: those in which Father, Son, and Holy Spirit are mentioned in connection, and those in which these three subjects are mentioned separately, and in which their nature and mutual relation are more particularly described. The disputes about the tri-personality of the Godhead date from the apostolic age, and were occasioned chiefly by the prevalence of the Hellenistic and Gnostic theosophies. Theophilus, bishop of Antioch in the 2d century, used the word *τριάς*, and its equivalent *trinitas* was first employed by Tertullian in the 3d century. During the ante-Nicene period there was uninterrupted controversy about this doctrine, principally in the East, and many opinions were proscribed by the church as heretical. Among them were those of the Ebionites, who regarded Jesus as a mere man; of the Sabellians, according to whom the Father, the Son, and the Holy Ghost were only the different forms in which the one God reveals himself to men; of the Arians, who taught that the Son was not coeternal with the Father, but created by him before the world, and therefore subordinate and in-

ferior to the Father; and of the Macedonians, who denied the personality of the Holy Ghost. The doctrine of the church was fixed by the councils of Nice (325) and Constantinople (381), which declared that the Son and Spirit are coequal with the Father in the divine unity, the Son eternally begotten by the Father, and the Spirit proceeding from the Father. The synod of Toledo (589) declared that the Holy Ghost proceeded also from the Son (*filioque*), and this addition was finally adopted throughout the Latin church; but the Greeks, though at first acquiescent and silent, at length protested against this change of the creed as an innovation, and the phrase *filioque* still remains one of the chief hindrances of a reunion between the Greek and Roman Catholic churches. The symbolic books of the Lutheran and Reformed churches retained the Roman Catholic doctrine of the Trinity unchanged; but it has been attacked ever since the 16th century, as contrary to both the Bible and sound reason, by a large number of theologians and by several new denominations, as the Socinians, the German theosophists (Weigel, Boehm, &c.), the Unitarians, and the Universalists. Swedenborg referred the Trinity to the person of Christ, teaching a trinity, not of persons, but of the person, by which he understood that that which is divine in the nature of Christ is the Father, that the divine which is united to the human is the Son, and the divine which proceeds from him is the Holy Spirit. The spread of rationalism in the Lutheran and Reformed churches undermined for some time the belief in the Trinity among a large number of German theologians. Kant held that Father, Son, and Spirit designate only three fundamental qualities in the Deity, power, wisdom, and love, or three agencies of God, creation, preservation, and government. Hegel and Schelling attempted to give to the doctrine of the Trinity a speculative basis; and after their example the modern dogmatic theology of Germany has in general undertaken a defence of the doctrine of the Trinity on speculative as well as theological grounds. Some supranaturalist theologians do not hold the strict doctrine of ecclesiastical orthodoxy, as defined by the councils of Nice and Constantinople, and the view of Sabellius especially has found in modern times many advocates.—Exhaustive works on the history of the doctrine of the Trinity have been published by Baur (*Die christliche Lehre von der Dreieinigkeit*, Tübingen, 8 vols., 1841-'8) and Meier (*Die Lehre von der Trinität in historischer Entwicklung*, Hamburg, 1844). See also Hodge, "Systematic Theology" (3 vols., New York, 1872-'8).

**TRINITY.** I. An E. county of Texas, bounded N. E. by the Neches and S. W. by the Trinity river, and drained by several creeks; area, 945 sq. m.; pop. in 1870, 4,141, of whom 1,084 were colored. The surface is nearly level, and the soil fertile. The Houston and Great North-

ern railroad passes through the W. part. The chief productions in 1870 were 94,240 bushels of Indian corn, 31,083 of sweet potatoes, 48,260 lbs. of butter, and 2,205 bales of cotton. There were 1,318 horses, 4,872 milch cows, 10,051 other cattle, 1,694 sheep, and 12,648 swine. Capital, Sumter. **II.** A N. W. county of California, bounded E. by the Coast range, intersected by the Trinity, and drained by tributaries of Eel river; area, 1,800 sq. m.; pop. in 1870, 3,213, of whom 1,099 were Chinese. The surface is generally hilly and in the E. part mountainous, Mt. Linn, the highest peak of the range, lying in the S. E. corner. There are extensive forests of fir, pine, and oak. Gold mining is prosecuted to a considerable extent, and other valuable minerals are found. The chief productions in 1870 were 9,898 bushels of wheat, 5,658 of potatoes, and 1,017 tons of hay. There were 185 horses, 425 milch cows, 1,283 other cattle, 371 swine, and 5 saw mills. Capital, Weaverville.

**TRINITY.** I. A river of Texas, formed by the West fork and Elm fork, which rise near the N. boundary of the state, and, after a course of about 150 m. each, unite in Dallas co., whence the main stream flows in a tortuous but generally S. S. E. direction to the N. extremity of Galveston bay, about 85 m. from Galveston city. Its whole course lies through a valley of great fertility, occupied in part by extensive plantations of corn, cotton, rice, and sugar. The length of the main stream is about 550 m., of which about 250 m. is navigable. **II.** A river of California, rising in Trinity co., and flowing S. S. E., then S. W., and finally N. W. into the Klamath river, in lat. 41° 20' N. It is celebrated for its rich gold mines.

**TRINITY COLLEGE**, an institution of learning in Hartford, Conn., under the control of the Protestant Episcopal church, chartered in 1823 and opened in 1824. Until 1845 its name was Washington college. Its presidents have been: 1824-'31, the Rt. Rev. Thomas C. Brownell, D. D., bishop of Connecticut; 1831-'7, the Rev. N. S. Wheaton, D. D.; 1837-'48, the Rev. Silas Totten, D. D.; 1848-'53, the Rt. Rev. John Williams, D. D.; 1853-'60, the Rev. Daniel R. Goodwin, D. D.; 1861-'4, Samuel Eliot; 1864-'6, the Rt. Rev. J. B. Kerfoot, D. D.; 1867-'74, the Rev. Abner Jackson, D. D. Dr. Jackson was succeeded by the Rev. T. R. Pynchon, D. D., who still holds the office (1876). In 1872 the college grounds were sold for \$600,000, to be used as a site for the new state capitol. Soon afterward the college purchased 78 acres within the city limits, a mile south of the old location. There is now in process of erection here an imposing college structure, in the form of a quadrangle 1,050 ft. long and 376 ft. wide, and enclosing three courts containing an aggregate of about four acres. It is in the early English style of architecture, with gateways and a noble tower and spire 240 ft. high. It will comprise dormitories for 800 students, recita-

tion rooms, chapel, library, museum, dining hall, theatre, astronomical observatory, and dwellings for the faculty. The college is to be removed to the new site in 1877. The whole number of the alumni of Trinity college is 1,068, of whom 262 have been ordained to the

New Buildings of Trinity College, Hartford.

ministry. In 1875-'6 there were, besides the president, 8 professors, 8 other instructors, and 2 lecturers; the total number of students was 88. The course of instruction, in which all the studies are prescribed, occupies four years. Students may take special courses in studies pertaining to science, and on their completion receive the degree of bachelor of science. Besides 37 scholarships entitling the holders to free tuition, there are several which yield to needy students annual incomes ranging from \$100 to \$300. Nearly all of them are designed to aid students preparing for the ministry in the Protestant Episcopal church. The college has property amounting in 1875 to \$1,068,296, a library of 18,000 volumes, exclusive of pamphlets and duplicates, and a valuable cabinet. Excepting \$16,000 received from the state, the funds of the college have been contributed by individuals. A theological school was organized in 1851, and was continued for about three years, when the Berkeley divinity school at Middletown was established to take its place.

**TRIPANG.** See SEA CUCUMBER.

**TRIPOLI**, an earthy substance, originally procured from Tripoli in Africa, used as a polishing material, of fine sharp grain, yellowish gray or whitish, burning white. It consists almost entirely of silica, and when examined by the microscope is found to be composed of the exuviae or skeletons of infusoria, the families of which are readily recognized. Specimens of it from Bilin and Franzensbad in Bohemia, Santaflora in Tuscany, and Mauritius have been examined by Ehrenberg. The sub-

stance has sometimes been confounded with the English rotten stone.

**TRIPOLI** (called by the natives *Tarabul*). I. A country of N. Africa, forming one of the Barbary states, and a dependency of the Turkish empire, bounded N. by the Mediterranean, E. by Barca, S. by Fezzan and the desert of Sahara, and W. by the Sahara and Tunis, between lat. 28° and 33° 15' N., and lon. 10° and 20° E.; extreme length about 650 m., breadth from 130 to nearly 300 m.; area estimated at 125,000 sq. m.; pop. estimated at from 500,000 to 750,000. Including Barca and Fezzan, which are dependent states, the area of Tripoli is more than double that above given, and the population probably twice as large. Though the sea coast extends upward of 600 m., there is only one good harbor, that of Tripoli, in its entire length. In its E. part, between Cape Mesurata and the town of Benghazi in Barca, there is a vast indentation called by the ancients Syrtis Major, now the gulf of Sidra. (See SYRTIS.) A marshy tract 100 m. in length and varying in breadth from 2 to 40 m. extends parallel to the S. W. shore of the gulf. The western portion of the Tripolitan coast is low and sandy; but in the east it becomes higher, and has many rocky points that afford shelter to small craft, with good anchorage in some places. The soil is exceedingly porous, and most of the streams flow only during the rainy season. The interior of the country is imperfectly known. The N. E. part contains extensive tracts of barren sand, and partakes of the nature of the desert; but the S. part is

traversed by the Black mountains, descending in terraces which enclose fertile tracts. In the west two ranges of mountains, offsets of the Atlas, run nearly parallel with the sea, the N. range about 20 m. from the coast, and the S. 30 m. further inland. The former has a general height of about 2,000 ft., and is visible from the sea. These mountains are of volcanic origin, and many of the summits terminate in conical peaks. The space between the ranges contains many tracts of elevated table land, with a fertile soil produced by the decomposition of lava and basalt. Salt and sulphur are the only minerals obtained. Some of this land is carefully cultivated and irrigated. Abundant crops of grain are raised, and on the sides of the hills vines, olives, figs, almonds, and other fruits grow luxuriantly. There are extensive natural pastures upon which cattle are reared in great numbers. But the most fertile part of Tripoli is the country which surrounds the capital. This tract, about 5 m. broad, extends about 15 m. along the shore, and produces heavy crops of wheat, barley, millet, and maize. Dates and olives are grown, together with all the fruits of a temperate climate. The country S. of the plateaus contains very little productive land, and consists mainly of sand and gravel plains. The water, which is found only by digging from 100 to 200 ft., is bitter and brackish. In the few spots where grain can be raised there are villages, the inhabitants of which live in constant dread of the desert tribes. Rain falls abundantly in the N. part of the country from November to March, but during the rest of the year months often pass without a single shower, although there are copious dews in the summer, and the heat becomes very great, especially when the sirocco blows. In winter the weather is exceedingly variable, and frosts occur at night, while the temperature during the day often exceeds 70°. The horses of Tripoli are of a superior breed, and cattle are numerous on the table lands. Camels are extensively used as beasts of burden, and sheep and poultry are exported. Of wild animals the most common are wolves, foxes, hyænas, jackals, gazelles, antelopes, rabbits, hares, hedgehogs, and jerboas. Ostriches frequent the borders of the deserts, and most of the common birds of southern Europe are found. Bees are kept in large numbers, and the locusts which frequently visit the country in enormous swarms are utilized for food.—Tripoli contains numerous remains of antiquity, including ruins of Roman temples, theatres, and aqueducts. Many of these ruins have been buried deeply in the sand, but they can still be traced in the city of Tripoli and at other places. Coins, gems, and intaglios have been found in considerable numbers.—The population comprises Arabs, Moors, Turks, Mamelukes, Jews, and negro slaves. The Arabs form the greater part of the population in the country districts. The towns, of which Tri-

poli, Lebda, and Mesurata or Misratah are situated on the coast, are peopled mostly by Moors, Jews, and negro slaves. Some of the Arabs have fixed homes and reside in villages, but many of them are nomadic.—There are some manufactures of woollen goods, and cloth for tents is made of goats' hair. The trade of Tripoli is considerable. The exports by sea consist chiefly of wool, cattle, hides, gold dust, ostrich feathers, ivory, gum, dried fruits, saffron, senna, drugs, barilla, and sheep's fat; and the chief imports are clothes, spices, sugar, coffee, spirits, arms, cutlery, and hardware. In 1874 the exports to Great Britain were valued at £125,211, and the imports from that country at £288,257. Caravans arrive from the interior of Africa twice a year, and bring slaves, gold dust, and tropical commodities, which are exchanged for European goods.—The government of Tripoli is a pure despotism. The country in the wider sense is denominated a vilayet or province of Turkey, and its ruler is known as the bey. He is a pasha generally selected by the sultan from among the Turkish officers resident at the capital. In former times the revenue was chiefly derived from the prizes taken by corsairs, and the sale of captured Europeans into slavery; but since these sources were cut off, a system of monopolies has been adopted. The bey of Fezzan and the sheikhs of Barca and some neighboring tribes pay tribute, and taxes are imposed on land, on Jews and merchants, and on exports and imports. A considerable number of Jews and Christians reside in Tripoli, but the dominant religion is Mohammedan. The temperance enjoined by the prophet is not practised. Wine shops are kept openly, and receive the sanction of the government by paying a heavy license fee. Education is neglected, and the people are ignorant and bigoted.—Tripoli was conquered by the Romans from the Carthaginians, and became a part of the Roman province of Africa under the name of Regio Syrtica. Its present appellation appears to have originated in a federation of three cities, Sabrata or Abrotonum, Cea, and Leptis Magna (the present Lebda), whence the region was called Tripolitana. It was conquered by the Vandals in the 5th century, and by the Mohammedans shortly after the death of Mohammed. After the division of the eastern caliphate Tripoli became an independent state. The capital was taken by Roger II. of Sicily in 1146, and retaken by Yakub and the fortifications destroyed in 1184. It was afterward subject to Tunis till about 1510, when it was conquered by the Spaniards; and it was ceded by the emperor Charles V. to the knights of St. John of Jerusalem in 1530. In 1551 the knights were expelled by Sultan Solymán II., and the tract of country which at present constitutes the vilayet was annexed to the city of Tripoli. The celebrated pirate Dragut, who had assisted at its capture, was made the first governor, and he initiated a

system of piratical plunder which was continued for centuries. The Christian nations and their commerce were the objects of attack, and all prisoners taken were sold into slavery. The capital was bombarded by a French fleet in 1683, when the pasha professed submission to Louis XIV. A controversy with the United States grew out of the practice of piracy, and after several conflicts in 1801-'5, in which Commodores Preble and Decatur chiefly distinguished themselves (see PREBLE, and DECATUR), the latter in 1815 enforced reparation for injuries inflicted by the Tripolitans upon American commerce. In 1816 a similar mission was undertaken by a British force, which compelled the bey to renounce piracy and agree to treat all future prisoners according to the usages of civilized nations. Though Tripoli is a dependency of the Ottoman empire, the bey enters into treaties with foreign powers without consulting any superior. In

early times beys were appointed from Constantinople and supported by a Turkish garrison, but a Moorish chief, Hamed Karamauli, rebelled successfully in 1713 and established himself as bey. His descendants continued to rule the country till 1832, when the last bey of the line was compulsorily removed on account of his excessive oppressions, and the Porte has since resumed its authority. The chiefs of the interior acknowledge but slight allegiance, and maintain amicable relations with the bey chiefly because the commerce carried on through the capital is advantageous to them; and the Arabs sometimes resort to open hostilities. II. A city (anc. *Ze*), the capital, situated upon a rocky promontory on the Mediterranean, about 600 m. S. E. of Algiers, and 300 m. S. of the Sicilian coast, in lat.  $32^{\circ}54'N.$ , lon.  $18^{\circ}11'E.$ ; pop. about 24,000. The land defences are a castle and wall flanked by bastions, and seaward there are strong batteries. The harbor no-

Port of Tripoli.

where exceeds five or six fathoms in depth, but the roadstead affords deep anchorage. The streets are narrow and uneven, and the houses low and irregular. They are nearly all one story high, without exterior windows, built of stones and mud, and whitewashed. Tripoli contains six handsome mosques and many others. The roof of the great mosque is formed by small cupolas, supported by 16 marble columns. There are Christian places of worship, a Franciscan convent, and several synagogues; and all religions are tolerated within the limits of the city. The pasha's residence is an immense building of very irregular appearance, constructed at different times. There are numerous caravansaries, two bazaars, and many fine public baths. Woollen goods (particularly carpets), leather, and potash are manufactured. A great part of the trade of the state, as well as that of the interior of Africa, centres at Tripoli. The merchants are principally Jews, who trade under monopolies granted by the government. There is frequent steam communication with the ports of Europe. The foreign commerce is chiefly with Malta, Marseilles, Leghorn, Trieste, and the Levant; and

the land trade is carried on by means of caravans with all the surrounding countries and as far as Morocco, Timbuctoo, and Mecca. The city contains several remains of antiquity, the most remarkable of which is a triumphal arch of marble, erected in A. D. 164 to the Roman emperor Marcus Aurelius and his colleague Lucius Verus; the inscription is perfect, although the sculptures are greatly defaced.

**TRIPOLI**, *Tarabulus*, or *Tarabulus* (anc. *Tripolis*), a seaport town of Syria, on the Mediterranean, in lat.  $34^{\circ}26'N.$ , lon.  $35^{\circ}49'E.$ , 40 m. N. N. E. of Beyrout, and 70 m. N. W. of Damascus; pop. about 16,000, one half Greek Catholics. It stands at the foot of an offset of Mt. Lebanon, on a small triangular plain, with the sea at a little distance on the N. and S. sides. A hill on the south is crowned by an old castle; and the town is divided into two parts by the Nahr Kadisha. The harbor, at El Mina, about  $1\frac{1}{2}$  m. to the northwest, is small, shallow, and unsafe. There are several mosques, which are generally fine buildings, most of them formerly Christian churches. It is one of the neatest towns in Syria, and is surrounded by many fine gardens and groves of orange and

other fruit trees; but the ground in the neighborhood is marshy, and the climate is unhealthy at certain seasons. It exports silk, wool, cotton, tobacco, wax, oil, cochineal, galls, soap, and especially sponges, the fishery of which occupies a large number of the inhabitants. The direct imports into Tripoli in 1869 were valued at \$61,050, and in 1872 at \$154,900; the direct exports, \$292,425 in 1869, and \$62,959 in 1872. The commerce is chiefly in the hands of Greeks. French steamers touch here four times a month. It is the see of a Greek bishop, and the residence of several consuls. —Tripolis was an important maritime town of Phœnicia, and derived its name from being the colony of the three cities of Tyre, Sidon, and Aradus, each holding a separate quarter of it. Having been taken by the crusaders, it was in 1109 erected into a county for Raymond of Toulouse.

**TRIPOLITZA**, or *Tripoli*, a town of Greece, in the Morea, capital of the nomarchy of Arcadia, 22 m. S. W. of Argos; pop. of the demus in 1870, 11,477. It is in a plain about 2,000 ft. above the sea, and owes its name to its being the modern representative of the three cities of Mantinea, Tegea, and Pallantium, which occupied the same plain. Before the revolution it was the residence of a Turkish pasha and capital of the Morea, and had 20,000 inhabitants. The Greeks took it in 1821 and put the inhabitants to the sword; 8,000 male Turks perished, besides women and children. In revenge, Ibrahim Pasha in 1825 destroyed every house in the place. It has been partially rebuilt. The ruins of Mantinea may be seen at Paleopoli, about 6 m. N., and of Tegea at Piali, nearly the same distance S.

**TRIPP**, a S. county of Dakota, bordering on Nebraska, recently formed and not included in the census of 1870; area, about 1,500 sq. m. It is intersected in the south by the Keya Paha, and watered in the north by Dog's Ears creek, an affluent of White river. In the S. part is Turtle hill, 2,340 ft. high. It consists mostly of undulating prairies.

**TRIPTOLEMUS**, in Greek mythology, a son of Celeus, king of Attica, and Neera, also called Metanira or Polymnia (according to another account, of Oceanus and Ge). He was born at Eleusis, and while still young was cured of a dangerous illness by Ceres, who had been hospitably entertained by his father, and attempted to render his brother Demophon (according to others, himself) immortal by burning out whatever particles of mortality he had derived from his parents. (See CERES.) The goddess taught him agriculture, and gave him her dragon chariot, in which he rode over the earth, spreading knowledge of the art. He afterward reigned at Eleusis, and was the hero of the Eleusinian mysteries.

**TRIQUET**, *Henri de*, baron, a French sculptor, born at Conflans in 1802, died in Paris in May, 1874. His earliest works consisted of genre and historical paintings, but in 1831 he ex-

hibited a fine group of "The Death of Charles the Bold," and henceforth devoted himself to sculpture. His works include "Petrarch reading his Poetry to Laura," "Sir Thomas More preparing to die," "Dante in the Elysian Fields," and many busts and bass reliefs.

**TRISMEGISTUS**. See HERMES TRISMEGISTUS.

**TRISTAN DA CUNHA**, a cluster of three volcanic islands in the S. Atlantic. Tristan, the largest island, lies in lat. 37° 8' S., lon. 12° 19' W., about 1,500 m. S. by W. of St. Helena; area, about 40 sq. m. It is nearly circular, and rises abruptly on the N. side to an elevation of 1,000 ft. From the summit of the cliffs the land rises to a conical peak 8,326 ft. high. The surface consists of abrupt ridges covered with bushes, with deep ravines and chasms between. The summit is a crater about 500 yards in diameter, filled with water. On the N. W. side of the island is a narrow plain 100 to 150 ft. above the sea, with an excellent soil in a high state of cultivation. Near the N. extremity of this plain is a settlement which in 1870 contained 60 inhabitants, 85 of whom were children under 10 years. Nearly all are native born, the descendants of Europeans and Hottentots, with fine physique and dark skin, and are intelligent and hospitable. They have no government, disputes being settled by fist-cuffs, with by-standers to secure fair play. They own a small vessel, which runs to Cape Town to exchange seal skins and oil for clothing, groceries, &c. Seals, sea lions, sea elephants, and whales frequent the group, and sea birds and edible fish abound. Heavy masses of kelp surround the shores. There are no large trees, but an abundance of shrubbery, which with sea weed and drift wood furnishes ample supplies of fuel. There is an abundance of excellent water. The climate is equable and healthy. The temperature rarely rises above 70° F. or falls below the freezing point. The only anchorage is off the N. W. point, and is very insecure.—Inaccessible island lies 17½ m. S. W., and Nightingale 20 m. S. S. W. of Tristan. The former is elliptical, 4 m. in length and 2 m. in breadth, and rises abruptly about 500 ft., the surface being flat and barren. Nightingale island is round, about 1½ m. in diameter, and 200 ft. in height. Both are uninhabited.—The group was discovered by the Portuguese navigator Tristan da Cunha in 1506, and explored by the Dutch in 1643, and by the French in 1767. Tristan was inhabited by John Patten, an American whaling master, with his crew, from August, 1790, to April, 1791, to collect seal skins. During the captivity of Napoleon at St. Helena it was occupied by British troops from Cape Town. The present inhabitants are chiefly descendants of one of these, a corporal named Glass.

**TRITON**, in Greek and Roman mythology, a marine deity, the son of Poseidon or Neptune and Amphitrite or Celæno. He had the form of a man above and that of a fish below, and bore a conch-shell trumpet.

**TRITON. I.** The proper name of the tailed batrachians of the old genus *triton* (Laur.), generally called newts or water salamanders; they all belong to the northern hemisphere,

Water Newt (*Triton palustris*).

and their species are most numerous in North America. The tail is depressed and adapted for swimming in most, though many are not strictly aquatic, but pass much of their life on the land, some visiting the water only during the breeding season; indeed, the distinction into terrestrial and aquatic species is very indefinite, species with either of these habits being found in one genus. In the breeding season, in the spring, the males acquire a fin-like fringe along the back and tail and membranous appendages to the toes; the species are difficult to distinguish on account of the varieties of sex, age, and season. Reproduction takes place by means of eggs, which are fecundated before they are deposited, and the young resemble tadpoles in form and gills. The most carefully studied species is the crested triton or water newt of Great Britain (*T. palustris*, Flem.), about 6 in. long, of which the tail is about two fifths; this species will suffice for the generic description. The body is naked, but covered with warty tubercles, and with glandular pores behind and over eyes and along sides; toes without nails, four anterior and five posterior; the dorsal and caudal crests separate; tongue slightly free on sides, and more free and pointed behind; palate with a double longitudinal series of teeth; no parotids nor glands along the back. The smooth-skinned species, without lateral pores and with a continuous dorsal and caudal crest, have been noticed under *ERR*. The head is flattened, nose rounded, gape large, teeth numerous and small, and the neck hardly distinct from the head and body. It is common in ponds and ditches, and one of the most aquatic of the family, swimming by means of the tail, the legs being turned back against the body; the legs are used as balancers in the water, and for a slow and feeble creeping on land; the skin comes off in shreds in the water, and is swallowed. The eggs are deposited on the leaves of aquatic plants, which are folded around them, one egg to each leaf; the parents resume a terrestrial

existence in a few weeks, but the young, born in June or July, remain, according to Bell, without much change till the following spring, when they acquire legs and leave the water. In the water they are voracious, feeding on aquatic animals, insects and larvæ, the tadpoles of the frog, and even those of their own species. They are noted for their tenacity of life under mutilation and exposure to severe cold, and for the power of reproducing lost parts. They are blackish or light brown above with darker round spots, and bright reddish orange below with round black spots, and the sides dotted with white.—The many-spotted triton of the Atlantic states (*T. dorsalis*, Harlan; genus *notophthalmus*, Raf.) is about 4 in. long, of which the tail is half; it is olive or greenish brown above, with a row of circular vermillion spots on each side, and below orange studded with small black dots; eyes prominent, with flame-colored iris; posterior limbs twice as large as anterior; it is eminently aquatic, and dies soon out of water from the drying of the skin; it is torpid only in the severest weather; it is found from Maine to Georgia, forming a very lively and interesting animal for the fresh-water aquarium, and easily obtained. Several other species occur on the Atlantic coast.

**II.** A genus of gastropod mollusks of the murex family, having a conical and elongated shell, spirally convoluted. The *T. variegatum* (Lam.), 12 to 16 in. long, from the Indian seas, is the

Sea Conch (*Triton variegatum*).

well known sea conch or trumpet of the god Triton; this species, as well as the *T. australe* (Lam.), is used by the Polynesians as a horn.

**TRIUMPH** (Lat. *triumphus*, related to Gr. *θρίαυφος*, a hymn sung in a procession in honor of Bacchus), generally, a solemn procession to celebrate a victory. The ancient Romans made the triumph a stimulus to martial exploits, and the highest military honor that could be obtained by a general, who entered the city in a chariot drawn by four horses, preceded by his captives and spoils and followed by his army, with which escort he passed along the Via Sacra, and ascending to the capitol sacrificed a bull to Jupiter. A triumph was granted by the senate to a general who had gained important successes, if he had already held one of the great offices of state; if the victory had been gained under his auspices and with his

troops; if the advantage had been positive and the number of enemies slain in a single battle at least 5,000; if it had been gained over a foreign enemy and not in a civil war; if the national dominion had been extended, and not merely recovered or relieved from the presence of the enemy; and if the war had been actually concluded so as to permit of the army's withdrawal from the conquered country. Sometimes the comitia of the tribes bestowed triumphs, and generals even triumphed in defiance of the senate and the people. Naval triumphs were also granted in some cases. After the overthrow of the republic, the emperors, in virtue of their authority as commanders-in-chief of the armies of the state, claimed the exclusive right of celebrating triumphs; and until A. D. 584, when Belisarius entered Constantinople in triumph after the overthrow of the Vandal kingdom in Africa, no subject had for more than five centuries enjoyed that distinction. This was the 350th triumph in Roman history, and the last ever celebrated. A lesser kind of triumph, called an ovation (*ovatio*) from the practice of sacrificing a sheep (*ovis*) instead of a bull, was granted to a general whose success did not entitle him to a full triumph.

**TRIUMVIRATE**, an office filled coördinately by three persons. Several magistracies of this description were recognized in the Roman government, of which the most important was that for the regulation of public affairs—*triumviri reipublicæ constituendæ*. Though magistrates with this title are thought to have been appointed as early as 360 B. C., there is no certain mention of them till toward the close of the republic. The coalition between Julius Cæsar, Pompey, and Crassus, in 60 B. C., is often called the first triumvirate, but they were never invested with any office under that title. The so-called second triumvirate of Octavius, Antony, and Lepidus (43) was the first sanctioned by the people. The office was bestowed on them for five years, and after the expiration of that term for five years more. Administration by triumvirs was apparently much favored by Roman legislators. The *triumviri capitales* had charge of the prisons and jurisdiction in minor cases; the *triumviri nocturni* had charge of the police at night. Mazzini, Armellini, and Saffi formed in February, 1849, a triumvirate at Rome, with the entire executive power placed in their hands.

**TROCHU**, *Louis Jules*, a French soldier, born at Palais, Brittany, in 1815. He studied at the academy of St. Cyr and at the special military school for the staff at Paris, and graduated in 1840 as a first lieutenant. After serving under Bugeaud in Algeria, he became Saint-Arnaud's aide-de-camp in the Crimea and commanded a brigade at Sebastopol. In 1859 he distinguished himself as general of division at the battle of Solferino. In 1867 appeared anonymously his *L'armée française en 1867* (20th ed., 1870), exposing the weakness of the

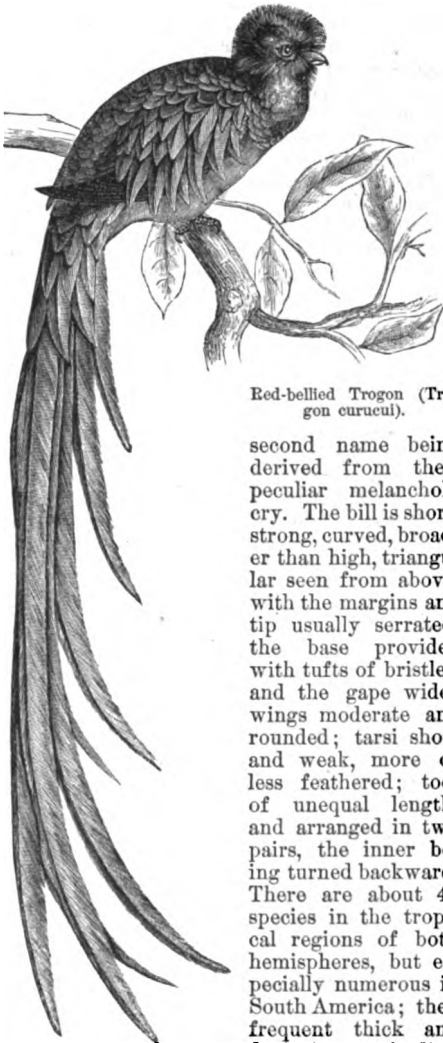

military resources, which gave umbrage to the emperor. It was only after his selection by Palikao for the organization of troops at the camp of Ohâlons that Napoleon reluctantly consented (Aug. 17, 1870) to his being made governor and chief commander of Paris. As such Trochu ordered the expulsion of the German residents, numbering about 80,000. On the establishment of the republican government (Sept. 4) he was placed at its head. In repeated proclamations he promised the rescue of the besieged city; and when its capitulation was unavoidable, he resigned the command in favor of Gen. Vinoy (Jan. 20, 1871), though remaining at the head of the government. He attempted to defend his administration in the assemblies at Bordeaux and Versailles, of the latter of which he was a member till the spring of 1872, when he retired in consequence of the unsatisfactory issue of a libel suit against the *Figaro* newspaper, which had attacked his course. In 1873 he left the army with a pension, and he has since been engaged at Tours in writing a military work.

**TROEZEN**, or *Trozene*, one of the oldest cities of ancient Greece, in the Peloponnesus, in a territory named from it Troezenia, forming the S. E. corner of Argolis. It was founded probably by the Ionians, and according to Homer was subject at the time of the Trojan war to Argos, from which it afterward received a Doric colony. Subsequently it became a prominent maritime city, founded Halicarnassus and Myndus in Caria, and probably Pæstum in Magna Græcia, and was conspicuous in the wars with Persia, its harbor being the rendezvous of the Grecian fleet after the sea fight at Artemisium. During the Peloponnesian, Corinthian, and other wars, it adhered to the side of Sparta. After the establishment of the Macedonian rule over Greece it was in the hands of various contending parties, and continued a place of some importance until the time of Pausanias, who describes its public buildings in detail; but after this period we have no account of its history. The ruins of the ancient city lie near the village of Damala, and consist principally of Hellenic foundations with Frankish or Byzantine superstructures.

**TROGLODYTES** (Gr. *τρογλοδύτης*, from *τρώγλη*, a cave, and *θεῖν*, to enter), the name given by the ancients to tribes of men who lived in caves. Several such are mentioned by ancient writers as inhabiting parts of Ethiopia, Upper Egypt, the borders of the Red sea, Mesia, Mauritania, and the northern part of the Caucasus. The most celebrated were those of southern Egypt and Ethiopia, where a large district was called Regio Troglodytica. They are represented as depending upon cattle for their livelihood, and living in the most debased condition. In part of Arabia the mountainous regions encompassing the wadys are filled with caves, which are occupied as permanent habitations by half savage tribes of Bedouins; and it is probable that these belong

to the same race as the troglodytic population of Ptolemy and other Greek geographers. In the early history of the Christian church the name was also applied to certain heretics, who, rejected by all parties, held their meetings in caves.—In natural history, Linnæus placed the chimpanzee under the genus *homo* with the specific name of *trogloodytes*, next to *homo sapiens*; and this is the *trogloodytes niger* of Geoffroy and the *simia troglodytes* of Blumenbach. The term is now applied to a genus which includes the chimpanzee and the gorilla, and also to a genus of the *trogloodytina* or wren family of birds.

**TROGON**, and **Coucouca**, names given to the scansorial birds of the family *trogonidæ*, the

Red-bellied Trogon (*Trogon curucui*).

second name being derived from their peculiar melancholy cry. The bill is short, strong, curved, broader than high, triangular seen from above, with the margins and tip usually serrated, the base provided with tufts of bristles, and the gape wide; wings moderate and rounded; tarsi short and weak, more or less feathered; toes of unequal length, and arranged in two pairs, the inner being turned backward. There are about 40 species in the tropical regions of both hemispheres, but especially numerous in South America; they frequent thick and damp forests, feeding

on insects, fruits, and berries; they are most active in morning and evening. A few live

in the islands of the Indian archipelago, and one genus in Africa. The American may be distinguished from the old world species by their barred tail. Though the neck and feet seem too short for the bulky body, the plumage is usually beautiful, often with metallic brilliancy. The eggs, two to four, are laid in the holes of rotten trees, and several broods are raised in a year. The species vary in size from a thrush to a magpie; it is rare to obtain good specimens, as they frequent the highest trees of the thickest forests, and when shot lose many of the soft and delicate feathers by the fall to the ground; the skin is very tender, and renders the operation of skinning so difficult that the natives dry the body with the feathers on.—In the genus *trogon* (Möhr.) the first quill is short and the fourth the longest. The red-bellied trogon (*T. curucui*, Linn.) is about a foot long, green above, red below, with the throat black, and the coverts and tail striped with the same; it is a native of Mexico. The peacock or splendid trogon (*calurus resplendens*, Swains; *T. pavoninus*, Temm.) has the edges of the bill smooth, the wing coverts long and curved, and the upper tail coverts greatly prolonged, entirely concealing the tail; it is larger than the last named, and the middle tail coverts are 8 to 8½ ft. in length; it is of a beautiful bronzed and golden green above and on the throat, and scarlet below; it is found in Mexico and Central America. The feathers of this and the preceding species are much prized for ornaments.—See the "Monograph of the Trogonidæ," by John Gould (fol., London, 1888).

**TROLLOPE, Edward**, an English author, born April 15, 1817. He graduated at Christ Church, Oxford, in 1839, and became rector of Leasingham, Lincolnshire, in 1843, prebend of Lincoln in 1861, and archdeacon of Stow in 1867. He has published several archæological and architectural works, the principal of which are: "Illustrations of Ancient Art" (1853); "Labyrinths, Ancient and Mediæval," and "Manual of Sepulchral Memorials" (1858); "Monastic Gate Houses" (1860); "Life of Hereward" (1861); "Norman Sculptures of Lincoln Cathedral" (1866); and "The Norman and Early English Styles of Gothic Architecture" (1869).

**TROLLOPE, L. Frances** (MILTON), an English novelist, born at Heckfield, Hampshire, about 1780, died in Florence, Italy, Oct. 6, 1868. She was the daughter of the Rev. William Milton, and in 1809 married Anthony Trollope, barrister at law. In 1829 she visited the United States, where she remained three years, residing chiefly in Cincinnati; and on her return she published "Domestic Manners of the Americans" (2 vols. 8vo, London, 1832), in which the indelicate and ridiculous phases of American character and habits were depicted. She afterward produced so large a number of novels and accounts of travels as to render her the most voluminous English authoress of the times. Her first work on America was fol-

lowed by a novel entitled "The Refugee in America" (1832), and in 1836 by "The Adventures of Jonathan Jefferson Whitlaw." About 1844 she went to Florence, where she resided till her death. Among her books of travel are: "Belgium and Western Germany in 1833" (2 vols., 1834); "Paris and the Parisians in 1835" (3 vols., 1836); "Vienna and the Austrians" (2 vols., 1838); "A Visit to Italy" (2 vols., 1842); and "Travels and Travelers" (2 vols., 1846). Some of her best novels are: "The Vicar of Wrexhill" (1837); "The Romance of Vienna" (1838); "The Widow Barnaby" (1839); "Life and Adventures of Michael Armstrong, a Factory Boy" (1840); "The Widow Married," a sequel to "The Widow Barnaby" (1840); "One Fault" (1840); "Charles Chesterfield, or the Adventures of a Youth of Genius" (1841); "Town and Country" (1847); "Lottery of Marriage" (1849); "Petticoat Government" (1850); "Young Heiress" (1853); "Life and Adventures of a Clever Woman" (1854); and "Fashionable Life" (1856). **II. Thomas Adolphus**, an English author, son of the preceding, born April 29, 1810. He has resided for many years in Florence and Rome, and has published "A Summer in Brittany" (2 vols. 8vo, 1840); "A Summer in Western France" (1841); "Impressions of a Wanderer in Italy" (1852); "The Girlhood of Catharine de' Medici" (1856); "A Decade of Italian Women" (1859); "Tuscany in 1849 and 1859" (1859); "Filippo Strozzi" (1860); "Paul V. the Pope and Paul the Friar" (1860); "La Beata" (1861); "Marietta" (1862); "A Lenten Journey in Umbria and the Marches of Ancona" (1862); "Giulio Malatesta" (1863); "Beppo the Conscript" (1864); "Lindisfarn Chase" (1864); "A History of the Commonwealth of Florence, from the Earliest Independence of the Commune to the Fall of the Republic in 1531" (4 vols. 8vo, 1865); "Gemma" (1866); "Artingdale Cas-

tle" (1867); "Dream Numbers" (1868); "Leonora Casaloni" (1869); "The Garstangs of Garstang Grange" (1869); "A Siren" (1870); and "Durnton Abbey" (1871). **III. Anthony**, an English novelist, brother of the preceding, born in 1815. From 1834 to November, 1867, he was connected with the British postal service, and he has been frequently sent abroad to establish postal conventions. He has visited the United States several times, the West Indies, Australia in 1871 and again in 1875, and other countries. In 1869 he was an unsuccessful liberal candidate for parliament for Beverly. For some time he was editor of the "St. Paul's" magazine, in which and in other periodicals several of his stories originally appeared serially. His works are: "The Macdermots of Ballydoran" (1847); "The Kellys and the O'Kellys" (1848); "La Vendée" (1850); "The Warden" (1855); "Barchester Towers," "The Three Clerks" (1857); "Doctor Thorne" (1858); "The Bertrams," "The West Indies and the Spanish Main" (1859); "Castle Richmond" (1860); "Framley Parsonage" (1861); "Tales of All Countries" (1861; 2d series, 1863); "Orley Farm," "The Struggles of Brown, Jones, and Robinson," "North America" (1862); "Rachel Ray" (1863); "The Small House at Allington," "The Belton Estate," "Hunting Sketches" (1864); "Oan You Forgive Her?" "Miss Mackenzie" (1865); "Olergymen of the Church of England," "Travelling Sketches" (1866); "The Claverings," "The Last Chronicle of Barset," "Lotta Schmidt, and other Stories" (1867); "Phineas Finn, the Irish Member," "He Knew he was Right" (1869); "Sir Harry Hotspur of Humblethwaite," "The Vicar of Bullhampton" (1870); "Ralph the Heir" (1871); "The Golden Lion of Granpère" (1872); "Phineas Redux," "Australia and New Zealand" (1873); "The Way we Live now," "Lady Anna" (1874); and "The Prime Minister" (1875).
